

ARIB STD-T64-C.S0036-A v1.0

**Recommended Minimum
Performance Standard for
Mobile Stations with Position
Service**

Refer to "Industrial Property Rights (IPR)" in the preface of ARIB STD-T64 for Related Industrial Property Rights. Refer to "Notice" in the preface of ARIB STD-T64 for Copyrights

1 **Original Specification**

2 This standard, ARIB STD-T64-C.S0036-A v1.0, was prepared by 3GPP2-WG of Association of
3 Radio Industries and Businesses (ARIB) based upon the 3GPP2 specification, C.S0036-A v1.0.

4

5 **Modification to the original specification**

6 None.

7

8 **Notes**

9 None.

10

3GPP2 C.S0036-A

Version 1.0

Date: October 2011

Revision History

Revision	Description Of Changes	Date
Rev 0 v1.0	Initial Publication	March 2002
Rev 0 v2.0	bug fix	June 2010
Rev A v1.0	New test cases added	July 2011
Rev A v1.0	Republication text	October 2011

CONTENTS

1	1 INTRODUCTION	1-1
2	1.1 Scope	1-1
3	1.2 Terms and Definitions	1-2
4	1.3 General Test Procedures	1-10
5	1.4 Test Modes.....	1-10
6	1.5 Tolerances	1-11
7	1.5.1 CDMA System Parameter Tolerances	1-11
8	1.5.2 Measurement Tolerances.....	1-11
9	1.6 Measurement Data Evaluation	1-11
10	1.6.1 Evaluation of the Measurement Yield	1-15
11	1.6.2 Evaluation of the returned parameters	1-16
12	1.6.2.1 Evaluation with σ_1 , σ_2 and σ_1 , $\sigma_{80\%}$ Type Tests	1-17
13	1.6.2.1.1 Error Calculation.....	1-18
14	1.6.2.1.1.1 Calculation of Absolute Satellite Code Phase Error	1-20
15	1.6.2.1.1.2 Calculation of Relative Satellite Code Phase Error	1-22
16	1.6.2.1.1.3 Calculation of Pseudo Doppler Error	1-22
17	1.6.2.1.1.4 Calculation of Signal-to-Noise Ratio and Signal Strength Errors ..	1-22
18	1.6.2.1.1.5 Calculation of Pilot Phase Error.....	1-22
19	1.6.2.1.1.6 Calculation of Horizontal Position Error.....	1-23
20	1.6.2.2 Evaluation of the Returned RMS Error Estimates	1-23
21	2 GPS MINIMUM SPECIFICATIONS	2-1
22	2.1 GPS Performance Specifications	2-1
23	2.1.1 Stationary Location Tests	2-1
24	2.1.1.1 GPS Accuracy Test.....	2-1
25	2.1.1.1.1 Definition	2-1
26	2.1.1.1.2 Method of Measurement	2-2
27	2.1.1.1.3 Minimum Specification.....	2-2
28	2.1.1.2 GPS Dynamic Range Test	2-3
29	2.1.1.2.1 Definition	2-3

FOREWORD

- 1 1. This Specification uses the following verbal forms: “Shall” and “shall not” identify
2 requirements to be followed strictly to conform to the Specification and from which
3 no deviation is permitted. “Should” and “should not” indicate that one of several
4 possibilities is recommended as being particularly suitable, without mentioning or
5 excluding others; that a certain course of action is preferred but not necessarily
6 required; or that (in the negative form) a certain possibility or course of action is
7 discouraged but not prohibited. “May” and “need not” indicate a course of action
8 permissible within the limits of the Specification. “Can” and “cannot” are used for
9 statements of possibility and capability, whether material, physical, or causal.
- 10 2. There are four Annexes in this Specification. Annexes A, B, C and D are normative
11 and are considered part of this Specification. Annex D contains a data file
12 attachment that is normative and is considered part of this Specification.
- 13 3. The terms “location” and “position” are used interchangeably throughout this
14 document. In this respect the definition of the term differs from the historic use of
15 location in wireless systems to identify the mobile’s current serving system.
- 16 4. Those wishing to deploy systems compliant with this Specification should also be
17 compliant with Parts 15, 22, 24, and 27 of [4] and with the applicable rules and
18 regulations of local administrations.
- 19 5. Those wishing to deploy systems in the United States should also take notice of the
20 requirement to be compliant with Federal Communications Commission (FCC)
21 Rulings on 911 Emergency Services. Meeting the requirements contained in this
22 Specification does not guarantee compliance with the FCC requirements listed in
23 [24].
- 24 6. The operation and messages specified in [1] apply to what is usually known as
25 handset-based position location method. The testing of network-based methods is
26 beyond the scope of this Specification.
- 27 7. Footnotes appear at various points in this Specification to elaborate and to further
28 clarify items discussed in the body of the Specification.
- 29 8. Unless indicated otherwise, this document presents numbers in decimal form.
30 Binary numbers are distinguished in the text by the use of single quotation marks.
- 31 9. The following operators define mathematical operations:
- 32 \times indicates multiplication.
- 33 $/$ indicates division.
- 34 $+$ indicates addition.
- 35 $-$ indicates subtraction.
- 36 $*$ indicates complex conjugation.
- 37 \in indicates a member of the set.
- 38 $\lfloor x \rfloor$ indicates the largest integer less than or equal to x : $\lfloor 1.1 \rfloor = 1$, $\lfloor 1.0 \rfloor = 1$.
- 39 $\lceil x \rceil$ indicates the smallest integer greater or equal to x : $\lceil 1.1 \rceil = 2$, $\lceil 2.0 \rceil = 2$.
- 40 $|x|$ indicates the absolute value of x : $|-17| = 17$, $|17| = 17$.

NOTES

- 1 \oplus indicates exclusive OR (modulo-2 addition).
- 2 $\min(x, y)$ indicates the minimum of x and y .
- 3 $\max(x, y)$ indicates the maximum of x and y .
- 4 $x \bmod y$ indicates the remainder after dividing x by y : $x \bmod y = x - (y \times \lfloor x/y \rfloor)$.
- 5 $\text{Re}\{x\}$ indicates the real part of x .
- 6 $\text{Im}\{x\}$ indicates the imaginary part of x .
- 7 9. This Specification supports testing of mobile stations compliant with [1].
- 8 10. This Specification supports testing of mobile stations that meet the minimum
- 9 specifications specified in [10].
- 10 11. This Specification tests only the position location functionality of a mobile station.
- 11 Testing interoperation with other services, such as voice, data or SMS, is beyond the
- 12 scope of this document.
- 13 12. This Specification does not support testing mobile station cold start time to first fix
- 14 requirements.
- 15 13. References in this document are to TIA/EIA-95-B. This Specification is equally
- 16 applicable to TIA/EIA/IS-2000 and TIA/EIA/IS-2000-A. Except where explicit
- 17 references are made to TIA/EIA/IS-2000, the reference to TIA/EIA-95-B can be
- 18 converted directly to TIA/EIA/IS-2000 and TIA/EIA/IS-2000-A usage.
- 19 14. The terms “base station” and “base station simulator” are used interchangeably
- 20 throughout this document, reflecting the fact that either type of equipment may be
- 21 used as long as all test equipment requirements given in this Specification are
- 22 satisfied.
- 23 15. Some tests in this revision specify using a physical CDMA channel that is not
- 24 mandatory for IS-2000-A mobile stations. If the mobile station does not support a
- 25 specified physical channel, then the equivalent IS-2000-A-only physical channel
- 26 should be used instead. Specifically, the Broadcast Control Channel and Forward
- 27 Command Control Channel should be used in place of the Paging Channel, the
- 28 Enhanced Access Channel should be used in place of the Access Channel, and the
- 29 Dedicated Control Channel should be used in place of the Traffic (Fundamental)
- 30 channel.
- 31 16. For the test parameter tables, I_{or} is specified in terms of power spectral density in a
- 32 Spreading Rate 1 bandwidth. For testing applicable to Spreading Rate 3, the total
- 33 received power in a Spreading Rate 3 bandwidth is effectively 5 dB higher.
- 34 17. Wherever this document refers to CDMA System time in frames, it is taken to mean
- 35 an integer value T such that: $T = \lfloor t/0.02 \rfloor$, where t represents System Time in
- 36 seconds.
- 37 18. The tests will be performed using modulated L1 carriers; however, the specification
- 38 of the signal levels is based upon an unmodulated L1 carrier, referenced to the
- 39 mobile station antenna input.

REFERENCES

1 The following Specifications contain provisions that, through reference in this text,
2 constitute provisions of this Specification. At the time of publication, the editions indicated
3 were valid. All Specifications are subject to revision, and parties to agreements based on
4 this Specification are encouraged to investigate the possibility of applying the most recent
5 editions of the Specifications indicated below. ANSI and TIA maintain registers of currently
6 valid national Standards published by them.

7 References are either specific (identified by date of publication, revision identifier, and
8 version number) or non-specific.

9 • For a specific reference, subsequent revisions may not apply.

10 • For a non-specific reference, the latest revision applies.

1 **1 INTRODUCTION**

2 **1.1 Scope**

3 This Specification details definitions, methods of measurement, and minimum performance
4 characteristics for Position Location Capable Code Division Multiple Access (CDMA) mobile
5 stations. This Specification shares the purpose of [1] (and subsequent revisions thereof) by
6 ensuring that a mobile station's location can be determined in any wireless system that
7 meets the compatibility requirements of [1].

8 Test methods are recommended in this document; however, methods other than those
9 recommended may suffice for the same purpose.

10

1 **1.2 Terms and Definitions**

2 **2D Fix.** A two-dimensional (latitude and longitude) position determination process.

3 **3D Fix.** A three-dimensional (latitude, longitude and height) position determination
4 process.

5 **Access Channel.** A Reverse CDMA Channel used by mobile stations for communicating to
6 the base station. The Access Channel is used for short signaling message exchanges, such
7 as call originations, responses to pages, and registrations. The Access Channel is a slotted
8 random access channel.

9 **Advanced Forward Link Trilateration (AFLT).** A geolocation technique that utilizes the
10 mobile station's measured time-difference-of-arrival of radio signals from the base stations
11 (and, possibly, other terrestrial measurements).

12 **AFLT.** See Advanced Forward Link Trilateration.

13 **Almanac.** See GPS Almanac.

14 **Alpha.** See Alpha, Beta Parameters.

15 **Alpha, Beta Parameters.** Ionospheric parameters, which allow the "L1 only" user to utilize
16 the ionospheric model for computation of the ionospheric delay. Alpha and Beta
17 parameters are contained in page 18 of subframe 4 of the GPS navigation message frame.

18 **Assistance Data.** The assistance data provided by the base station to the mobile station
19 for various purposes (for example, acquisition, location calculation or sensitivity
20 improvement).

21 **Authentication.** An algorithmic exchange procedure used by a base station to validate a
22 mobile station's identity.

23 **Autonomous Mobile Station.** A mobile station that is capable of autonomously
24 determining its own position without any help from the base station.

25 **Autonomous Base Station.** A base station capable of determining the location of the
26 mobile station without requiring any cooperation from the mobile station.

27 **Azimuth.** An angle that specifies a direction in the horizontal plane, expressed in degrees
28 measured clockwise from True North.

29 **AWGN.** Additive White Gaussian Noise.

30 **Bad Satellite.** A bad satellite is one that is unusable for position calculation. See Satellite
31 Health.

32 **Band Class.** A set of frequency channels and a numbering scheme for these channels.

33 **Base Station.** The base station includes the transceiver equipment, Mobile Switching
34 Center (MSC), Mobile Positioning Center (MPC), Position Determination Entity (PDE) and
35 any Inter-Working Function (IWF) required for network connection.

- 1 **Base Station Almanac.** The location coordinates and reference time correction parameters
2 for a collection of base stations in the immediate neighborhood of the mobile station (the
3 size of the immediate neighborhood is a service provider option).
- 4 **Beta.** See Alpha, Beta Parameters.
- 5 **bps.** Bits-per-second.
- 6 **C/A Code.** Coarse/Acquisition code used for spectral spreading of the GPS signal.
- 7 **C/A Code Chip.** The interval defined by the chipping (spreading) rate of the GPS C/A code.
8 Stated as a time interval, one chip equals approximately 977.5 ns; as a distance it is
9 approximately 293.0 m.
- 10 **C/No.** The ratio of the unmodulated carrier signal power (C) to the power spectral density
11 of background noise (N_0).
- 12 **CDMA.** See Code Division Multiple Access.
- 13 **CDMA Channel.** The set of channels transmitted between the base station and the mobile
14 station within a given CDMA frequency assignment.
- 15 **CDMA Code Boundary.** The point in time where the system time modulo the PN code
16 period is precisely zero.
- 17 **CDMA System Time.** All base station digital transmissions are referenced to a common
18 CDMA system-wide time scale that uses the Global Positioning System (GPS) time scale,
19 which is traceable to and synchronous with Universal Coordinated Time (UTC). GPS and
20 UTC differ by an integer number of seconds, specifically the number of leap second
21 corrections added to UTC since January 6, 1980. The start of CDMA System Time is
22 January 6, 1980 00:00:00 UTC, which coincides with the start of GPS time. (See
23 TIA/EIA/95-B Section 1.2). Note that if the CDMA baseband transmit signal is modeled as
24 a complex impulse train passed through a symmetric non-causal filter, then the precise
25 zero instant of system time modulo the pilot PN sequence code period is given by the
26 midpoint between the impulse representing the last element of the pilot PN sequence and
27 the subsequent impulse representing the first element of the pilot PN sequence. The
28 impulse train represents the pilot PN sequence, where the impulses are separated by
29 exactly one PN code chip. The symmetric non-causal filter represents the baseband filter
30 shape prior to the pre-equalization filter.
- 31 **CNAV.** See GPS CNAV Message.
- 32 **CNAV-2.** See GPS CNAV-2 Message.
- 33 **Code Channel.** A subchannel of a Forward CDMA Channel or Reverse CDMA Channel.
34 Each subchannel uses an orthogonal Walsh function or quasi-orthogonal function.
- 35 **Code Division Multiple Access (CDMA).** A technique for spread-spectrum multiple-access
36 digital communications that creates channels through the use of unique code sequences.
- 37 **Code Phase.** At a given time, the code phase is the fraction of the code period that has
38 elapsed since the latest code boundary (GPS or CDMA).
- 39 **Code Phase Search Window.** The expected range of possible code phase values.

- 1 **dBm.** A measure of power expressed in terms of its ratio (in dB) to one milliwatt.
- 2 **dBm/Hz.** A measure of power spectral density. The ratio, dBm/Hz, is the power in one
3 Hertz of bandwidth, where power is expressed in units of dBm.
- 4 **dBW.** A measure of power expressed in terms of its ratio (in dB) to one watt.
- 5 **DGNSS.** Differential GNSS.
- 6 **DGPS.** Differential GPS.
- 7 **Dilution of Precision.** A measure of position determination accuracy that is solely a
8 function of the geometrical layout of the reference points used in the position
9 determination, as seen from the estimated position (for GPS, position of the satellites
10 relative to the receiver antenna). One-sigma position error is approximately the product of
11 the value of the Dilution of Precision and the one-sigma error in measured range from the
12 mobile station to the reference points.
- 13 **DOP.** See Dilution of Precision.
- 14 **Doppler n^{th} Order.** The n^{th} order moment specifying a satellite's observed Doppler.
- 15 **Doppler Search Window.** The expected range of possible Doppler values.
- 16 **E_b .** Average energy of an information bit at the mobile station antenna input.
- 17 $\frac{E_b}{N_t}$. The ratio in dB of the combined received energy per bit to the effective noise power
18 spectral density at the mobile station antenna input.
- 19 **E_c .** Average energy accumulated over one PN chip period.
- 20 $\frac{E_c}{I_{\text{or}}}$. The ratio in dB between the energy accumulated over one PN chip period (E_c) to the
21 total transmit power spectral density.
- 22 **ECEF.** "Earth-Centered-Earth-Fixed". A frame of reference for specifying positions that is
23 centered in the center of the Earth and rotates with it.
- 24 **EGNOS.** See SBAS.
- 25 **Elevation Angle.** The angle between a (GPS) satellite and the horizon, expressed in
26 degrees.
- 27 **Ephemeris.** The precise (high accuracy) orbital parameters of one GPS satellite, as
28 transmitted by that satellite in GPS subframes 2 and 3.
- 29 **Extended Base Station Almanac.** The location coordinates and reference time correction
30 parameters for a collection of base stations in the extended neighborhood of the mobile
31 station (the size of the extended neighborhood is a service provider option).
- 32 **Fix.** The process of performing position computation.
- 33 **Forward Traffic Channel.** One or more code channels used to transport user and
34 signaling traffic from the base station to the mobile station.

- 1 **Frame.** See GPS Navigation Message Frame.
- 2 **GAGAN.** See SBAS.
- 3 **Galileo.** Galileo is a global navigation satellite system currently being built by the European
4 Union (EU) and European Space Agency (ESA).
- 5 **Geolocation.** The process of determining a geographic location.
- 6 **GHz.** Gigahertz (10^9 Hertz).
- 7 **GLONASS.** GLObal'naya NAVigatsionnaya Sputnikovaya Sistema; (English: Global
8 Navigation Satellite System), developed by the former Soviet Union and now operated for
9 the Russian government by the Russian Space Forces.
- 10 **GNSS.** Global Navigation Satellite System is the standard generic term for satellite
11 navigation systems that provide autonomous geo-spatial positioning with global or regional
12 coverage, such as GPS, GLONASS, or Galileo.
- 13 **GPS.** Global Positioning System.
- 14 **GPS Almanac.** The almanac data are a reduced-precision subset of the clock and
15 ephemeris parameters for all satellites, as transmitted by every satellite in GPS subframes 4
16 and 5.
- 17 **GPS CNAV Navigation Message.** The GPS CNAV (Civil Navigation) data is an upgraded
18 version of the original NAV navigation message. It contains higher precision representation
19 and nominally more accurate data than the NAV data. The CNAV message format consists
20 of 300-bit message packets of different types.
- 21 **GPS CNAV-2 Navigation message.** The GPS CNAV-2 navigation message modulated on the
22 L1C signal consists of three subframes of varying length. Subframe 1 provides Time of
23 Interval (TOI) count, subframe 2 provides ephemeris and clock corections, and subframe 3
24 which varies from frame to frame provides almanac and other data.
- 25 **GPS Code Boundary.** The point in time where the system time modulo the C/A code
26 period is precisely zero.
- 27 **GPS Navigation Message Frame.** A GPS navigation message frame contains five
28 subframes. Subframes 1 through 3 contain ephemeris and clock parameters; subframes 4
29 and 5 contain message and almanac parameters.
- 30 **GPS Navigation Message Subframe.** One of the five GPS subframes of the GPS navigation
31 message. The subframe is 300-bits long.
- 32 **GPS Navigation Message Superframe.** A GPS navigation message superframe consists of
33 25 frames and has a duration of 12.5 minutes.
- 34 **Handset-based Position Location.** A position location method, where the underlying,
35 fundamental measurements to be used in the location calculation are made at the mobile
36 station. The location calculation itself can be performed by either the mobile station or by
37 one or more network entities. See also Network-based Position Location.
- 38 **ICD.** Interface Control Document.

- 1 **I_{oc}**. The power spectral density of a band-limited white noise source, simulating
2 interference from other cells or other channel interference or both, as measured at the
3 mobile station antenna input. See also OCNS.
- 4 **I_{or}**. The total transmit power spectral density of the Forward CDMA Channel at the base
5 station antenna output.
- 6 **I_{̂or}**. The received power spectral density of the Forward CDMA Channel as measured at the
7 mobile station antenna input.
- 8 **IWF**. InterWorking Function. A network entity enabling interactions between network
9 elements, such as interactions between an MSC and a landline function. The IWF usually
10 performs protocol conversions as its primary function.
- 11 **kHz**. Kilohertz (10^3 Hertz).
- 12 **Legacy Terminal**. A mobile station that does not support the position determination
13 techniques described in Reference [1].
- 14 **Location**. The terms “location” and “position” are used interchangeably throughout this
15 document. In this respect, the definition of the term differs from the historic use of location
16 in wireless systems to identify the mobile’s current serving system. See Position.
- 17 **LOS. Line of Sight**.
- 18 **LSB**. Least Significant Bit.
- 19 **Mean Input Power**. The total received calorimetric power measured in a specified
20 bandwidth at the antenna input, including all internal and external signal and noise
21 sources.
- 22 **Mean Output Power**. The total transmitted calorimetric power measured in a specified
23 bandwidth at the antenna output when the transmitter is active.
- 24 **MHz**. Megahertz (10^6 Hertz).
- 25 **MPC**. Mobile Positioning Center: The network entity that serves as the point of interface
26 of the wireless network for the exchange of geographic position information.
- 27 **Mobile Station (MS)**. A station that communicates with the base station.
- 28 **Mobile Station Originated Message**. A message originating from a mobile station.
- 29 **Mobile Station Terminated Message**. A message received by a mobile station.
- 30 **Mobile Switching Center (MSC)**. A configuration of equipment that provides cellular
31 radio-telephone service. Also called the Mobile Telephone Switching Office (MTSO).
- 32 **Modernized GPS**. The GPS modernization project involves new ground stations and new
33 satellites with additional navigation signals to improve the accuracy and availability for
34 GPS users. The additional navigation signals include a Civilian L2 (L2C) signal, a Safety-of-
35 Life L5 signal, and a new Civilian L1 (L1C) signal, together with improved navigation
36 message data (see CNAV, CNAV-2).
- 37 **ms**. Millisecond (10^{-3} second).
- 38 **MS**. See Mobile Station.

- 1 **MSAS.** See SBAS.
- 2 **MSB.** Most Significant Bit.
- 3 **MSC.** See Mobile Switching Center.
- 4 **Navigation Message Bits.** The message bits (50 bits-per-second) transmitted by GPS
5 satellites, containing the satellite clock, ephemeris, almanac and other parameters.
- 6 **N₀.** The effective inband noise or interference power spectral density.
- 7 **N_t.** The effective noise power spectral density at the mobile station antenna input.
- 8 **N/A.** Not applicable.
- 9 **Network-based Position Location.** A position location method, where the underlying,
10 fundamental measurements to be used in the location calculation are made by the
11 terrestrial network, typically by one or more base stations. See also Handset-based
12 Position Location.
- 13 **ns.** Nanosecond (10⁻⁹ second).
- 14 **N/S.** Not specified.
- 15 **OCNS.** See Orthogonal Channel Noise Simulator.
- 16 **OCNS E_c.** Average energy per PN chip for the OCNS.
- 17 $\frac{\text{OCNS } E_c}{I_{or}}$. The ratio of the average transmit energy per PN chip for the OCNS to the total
18 transmit power spectral density.
- 19 **Orthogonal Channel Noise Simulator.** A hardware mechanism used to simulate the users
20 on the other orthogonal channels of a Forward CDMA Channel.
- 21 **Paging Channel (PCH).** A code channel in a Forward CDMA Channel used for
22 transmission of control information and pages from a base station to a mobile station.
- 23 **PDE.** See Position Determination Entity.
- 24 **Pilot Channel.** An unmodulated, direct-sequence spread spectrum signal transmitted by a
25 CDMA base station or mobile station. A pilot channel provides a phase reference for
26 coherent demodulation and may provide a means for signal strength comparisons between
27 base stations for determining when to handoff.
- 28 **Pilot E_c.** Average energy per PN chip for the Pilot Channel.
- 29 $\frac{\text{Pilot } E_c}{I_o}$. The ratio of the received pilot energy per chip, E_C, to the total received power
30 spectral density (noise and signals).
- 31 $\frac{\text{Pilot } E_c}{I_{or}}$. The ratio of the transmit pilot energy per chip, E_C, to the total transmit power
32 spectral density.

- 1 **Pilot Phase Offset.** The time difference measured at the mobile station between the
2 earliest arriving useable multipath component of a pilot and the mobile station system time
3 reference. The AFLT technique is based primarily on Pilot Phase Offset data.
- 4 **Pilot PN Sequence.** A pair of modified maximal length PN sequences used to spread the
5 Forward CDMA Channel and the Reverse CDMA Channel. Different base stations are
6 identified by different pilot PN sequence offsets.
- 7 **PN.** Pseudonoise.
- 8 **PN Chip.** One bit in the PN sequence.
- 9 **PN Offset.** The PN offset measured in units of 64 PN chips of a pilot, relative to the zero-
10 offset pilot PN sequence.
- 11 **PN Sequence.** Pseudonoise sequence. A periodic binary sequence.
- 12 **Position.** The geographic position of the mobile station expressed in latitude and longitude
13 and height.
- 14 **Position Determination Entity (PDE).** A network entity that manages the position or
15 geographic location determination of the mobile station.
- 16 **ppb.** Parts-per-billion.
- 17 **Pseudodoppler.** The measured Doppler frequency shift in the signal received from the GPS
18 satellite. Since the satellite and receiver clock drifts are included, it is referred to as
19 pseudodoppler.
- 20 **Pseudorange.** The measured range (in GPS chips) from the observed satellite to the GPS
21 receiver antenna. Since the satellite and receiver clock biases are included, it is referred to
22 as pseudorange.
- 23 **Push.** An unsolicited response.
- 24 **PRN Number.** The GPS PRN signal number as defined in ICD-GPS-200C, table 3-I.
- 25 **QZSS.** Quasi-Zenith Satellite System (QZSS) is a regional navigation satellite system where
26 the eccentricity and elevation of the satellite orbits are selected so that the minimum
27 elevation angle through 24 hours in Japan is larger than about 60 degrees. The satellite
28 signals are fully compatible and interoperable with GPS and its modernization.
- 29 **Reference Bit Boundary.** A boundary between two 20-ms GPS bit intervals chosen as the
30 reference point for code phases.
- 31 **Reverse Traffic Channel.** A traffic channel on which data and signaling are transmitted
32 from a mobile station to a base station.
- 33 **RMS.** Root of Mean Square.
- 34 **s.** Second.
- 35 **Satellite Clock Correction.** Bits nine through 24 of word eight, bits one through 24 of
36 word nine, and bits one through 22 of word ten in GPS subframe one contain the
37 parameters needed by the user for apparent satellite clock correction (t_{oc} , a_{f2} , a_{f1} , a_{f0}).

- 1 **Satellite Health.** Satellite health is the information identifying a satellite as usable for
2 position calculation.
- 3 **SBAS.** Satellite Based Augmentation System. Several independent but compatible satellite
4 based augmentation systems exist: The American Wide Area Augmentation System (WAAS),
5 the European Geostationary Navigation Overlay Service (EGNOS), the Indian GPS Aided
6 GEO Augmented Navigation System (GAGAN), and the Japanese Multi-functional Satellite
7 Augmentation System (MSAS). The (GPS-like) ranging signals from all these SBASs are here
8 considered as a single GNSS, although this GNSS is not a standalone positioning system
9 because of the small number of satellites and their distribution in space.
- 10 **Sensitivity.** The minimum level (dBm) of received GPS signal at a mobile station that
11 allows the determination of the geolocation of the mobile station.
- 12 **Serving Frequency.** The CDMA frequency on which a mobile station is currently
13 communicating with one or more base stations.
- 14 **Subframe.** See GPS Navigation Message Subframe.
- 15 **Superframe.** See GPS Navigation Message Superframe.
- 16 **SV.** Space Vehicle: A way of referring to one of the GPS satellites.
- 17 **Time of Arrival.** The time occurrence, as measured at the mobile station antenna input, of
18 the earliest arriving usable multipath component of the signal.
- 19 **Traffic Channel.** A communication path between a mobile station and a base station used
20 for user and signaling traffic. The term Traffic Channel implies a Forward Traffic Channel
21 and Reverse Traffic Channel pair. See also Forward Traffic Channel and Reverse Traffic
22 Channel.
- 23 **Unsolicited Response.** A response element that is issued in the absence of the
24 corresponding request element.
- 25 **WAAS.** See SBAS.
- 26 **Walsh Function.** One of 2^N time orthogonal binary functions (note that the functions are
27 orthogonal after mapping '0' to 1 and '1' to -1).
- 28 **Weighting Factor.** Weighting factor is a weight applied to the GPS measurement as part of
29 a Weighted Least Squares Filter (WLSF) implementation of the navigation algorithm.
- 30 **WGS-84.** World Geodetic System - 1984.
- 31 **WGS-84 Reference Ellipsoid.** Worldwide datum reference system defining the surface of
32 the Earth (note: Supersedes WGS-72); i.e., the standard physical model of the Earth used
33 for GPS applications. Ellipsoid reference models are location-specific and may be obtained
34 from Defense Mapping Agency publication DMA TR 8350.2 (September 30, 1987).
- 35 **WLSF.** Weighted Least Squares Filter navigation algorithm.

1 **1.3 General Test Procedures**

2 The mobile station tests presented in this Specification support various position location
3 technologies that use an implementation compliant with [1]. Only the tests that are
4 applicable to the technology supported by the mobile station under testing should be
5 performed.

6 All applicable tests shall be performed at least once. Test results will be recorded in real-
7 time with all actual parametric performance logged where applicable.

8 **1.4 Test Modes**

9 Based on the position location call flows between the serving base station and the mobile
10 station during the tests, the following four test modes are defined:

11 1. Position Location Test Mode 1: This test mode is used for testing position location
12 operation when the mobile station originates a position location session¹ on the Access
13 Channel. Parts of the subsequent messaging related to the position location session
14 may be carried out on a dedicated channel using Location Service Option (Service
15 Option 35 or 36).

16 2. Position Location Test Mode 2: This test mode is used for testing position location
17 operation when the mobile station originates a position location session on a dedicated
18 channel. This test mode is entered by setting up a call using Voice Service Option or
19 Location Service Option (Service Option 35 or 36).

20 3. Position Location Test Mode 3: This test mode is used for testing position location
21 operation when the base station originates a position location session on the Paging
22 Channel. Parts of the subsequent messaging related to the position location session
23 may be carried out on a dedicated channel using Location Service Option (Service
24 Option 35 or 36).

25 4. Position Location Test Mode 4: This test mode is used for testing position location
26 operation when the base station originates a position location session on a dedicated
27 channel. This test mode is entered by setting up a call using a Voice Service Option
28 supported by the mobile station or Location Service Option (Service Option 35 or 36).

29 Position Location Test Modes 1 and 2 are only applied to mobile stations that support
30 mobile originated position location sessions.

31 Example call flows for these test modes are described in 6.10.2.

¹ The origination of the position location session, in general, is independent of the call origination. A position location session can, for example, be initiated by the PDE during a voice call, which had been originated by the mobile station. The initiator of the position location session is defined as the entity that sends the first *Position Determination Data Message*.

1 **1.5 Tolerances**

2 1.5.1 CDMA System Parameter Tolerances

3 CDMA parameters are specified in [11], [12]. All parameters indicated in [8], [9] and [10]
4 are exact, unless an explicit tolerance is stated.

5 1.5.2 Measurement Tolerances

6 Unless otherwise specified, a measurement tolerance, including the tolerance of the
7 measurement equipment, of $\pm 10\%$ is assumed. This $\pm 10\%$ tolerance includes, but is not
8 limited to the effects of VSWR, source signal levels, and variations in room temperature
9 (15°C to 35°C).

10 **1.6 Measurement Data Evaluation**

11 The minimum specifications presented in this document describe tolerances applicable to
12 numerical parameter values returned by the mobile station. The specified tolerance value
13 types are summarized in Table 1.6-1.

14

1

Table 1.6-1 Summary of Test Evaluation Parameters

Parameter	Description
T_1	Time limit for returning <i>Provide MS Information</i>
N	Minimum number of required parameter values
T_2	Time limit for returning the N parameter values
CODE _{1A}	The maximum absolute error level corresponding to the 67% point for SV_CODE_PH_WH/SV_CODE_PH_FR or “Satellite code phase – whole chips/Satellite code phase – fractional chips” in <i>Provide Pseudorange Measurement</i> message ² , or for “Code phase origin/Code phase” in <i>Provide GNSS Pseudorange Measurement</i> message
CODE _{2A}	The maximum absolute error level corresponding to the 95% point for SV_CODE_PH_WH/SV_CODE_PH_FR or “Satellite code phase – whole chips/Satellite code phase – fractional chips” in <i>Provide Pseudorange Measurement</i> message, or for “Code phase origin/Code phase” in <i>Provide GNSS Pseudorange Measurement</i> message
CODE _{3A}	The maximum absolute error level corresponding to the 80% point for “Code phase origin/Code phase” in <i>Provide GNSS Pseudorange Measurement</i> message
CODE _{1R}	The maximum relative error level corresponding to the 67% point for SV_CODE_PH_WH/SV_CODE_PH_FR or “Satellite code phase – whole chips/Satellite code phase – fractional chips” in <i>Provide Pseudorange Measurement</i> message, or for “Code phase origin/Code phase” in <i>Provide GNSS Pseudorange Measurement</i> message
CODE _{2R}	The maximum relative error level corresponding to the 95% point for SV_CODE_PH_WH/SV_CODE_PH_FR or “Satellite code phase – whole chips/Satellite code phase – fractional chips” in <i>Provide Pseudorange Measurement</i> message, or for “Code phase origin/Code phase” in <i>Provide GNSS Pseudorange Measurement</i> message

² SV_CODE_PH_WH/SV_CODE_PH_FR and “Satellite code phase – whole chips/Satellite code phase – fractional chips” of the *Provide Pseudorange Measurement* message are used interchangeably in this document.

CODE _{3R}	The maximum relative error level corresponding to the 80% point for “Code phase origin/Code phase” in <i>Provide GNSS Pseudorange Measurement</i> message
DPR ₁	The maximum error level corresponding to the 67% point for PS_DOPPLER or “Pseudodoppler” in <i>Provide Pseudorange Measurement</i> message ³ , or for “Satellite Pseudodoppler” in <i>Provide GNSS Pseudorange Measurement</i> message
DPR ₂	The maximum error level corresponding to the 95% point for PS_DOPPLER or “Pseudodoppler” in <i>Provide Pseudorange Measurement</i> message, or for “Satellite Pseudodoppler” in <i>Provide GNSS Pseudorange Measurement</i> message
DPR ₃	The maximum error level corresponding to the 80% point for “Satellite Pseudodoppler” in <i>Provide GNSS Pseudorange Measurement</i> message
CNO ₁	The maximum error level corresponding to the 67% point for SV_CNO or “Satellite C/No” in <i>Provide Pseudorange Measurement</i> message ⁴ , or for “Satellite C/No” in <i>Provide GNSS Pseudorange Measurement</i> message
CNO ₂	The maximum error level corresponding to the 95% point for SV_CNO or “Satellite C/No” in <i>Provide Pseudorange Measurement</i> message, or for “Satellite C/No” in <i>Provide GNSS Pseudorange Measurement</i> message
CNO ₃	The maximum error level corresponding to the 80% point for “Satellite C/No” in <i>Provide GNSS Pseudorange Measurement</i> message
PNPHASE ₁	The maximum error level corresponding to the 67% point for PILOT_PN_PHASE or “Pilot measured phase” in <i>Provide Pilot Phase Measurement</i> message ⁵

³ PS_DOPPLER and “Pseudodoppler” of the *Provide Pseudorange Measurement* message are used interchangeably in this document.

⁴ SV_CNO and “Satellite C/No” of the *Provide Pseudorange Measurement* message are used interchangeably in this document.

⁵ PILOT_PN_PHASE and “Pilot measured phase” of the *Provide Pilot Phase Measurement* message are used interchangeably in this document.

PNPHASE ₂	The maximum error level corresponding to the 95% point for PILOT_PN_PHASE or “Pilot measured phase” in <i>Provide Pilot Phase Measurement</i> message
RXPWR ₁	The maximum error level corresponding to the 67% point for TOTAL_RX_PWR or “Total received power” in <i>Provide Pilot Phase Measurement</i> message ⁶
RXPWR ₂	The maximum error level corresponding to the 95% point for TOTAL_RX_PWR or “Total received power” in <i>Provide Pilot Phase Measurement</i> message
REFPS ₁	The maximum error level corresponding to the 67% point for REF_PILOT_STRENGTH or “Pilot strength” in <i>Provide Pilot Phase Measurement</i> message ⁷
REFPS ₂	The maximum error level corresponding to the 95% point for REF_PILOT_STRENGTH or “Pilot strength” in <i>Provide Pilot Phase Measurement</i> message
PS ₁	The maximum error level corresponding to the 67% point for PILOT_SRENGTH or “Pilot strength” in “Pilot phase information” IE of the <i>Provide Pilot Phase Measurement</i> message ⁸
PS ₂	The maximum error level corresponding to the 95% point for PILOT_SRENGTH or “Pilot strength” in “Pilot phase information” IE of the <i>Provide Pilot Phase Measurement</i> message
LATLONG ₁	The maximum error level corresponding to the 67% point for LAT/LONG or “Latitude/Longitude” in <i>Provide Location Response</i> message ⁹ or for “Latitude/Longitude” in <i>Provide Advanced Location Response</i> message
LATLONG ₂	The maximum error level corresponding to the 95% point for LAT/LONG or “Latitude/Longitude” in <i>Provide Location Response</i> message or for “Latitude/Longitude” in <i>Provide Advanced Location Response</i> message

⁶ TOTAL_RX_PWR and “Total received power” of the *Provide Pilot Phase Measurement* message are used interchangeably in this document.

⁷ REF_PILOT_STRENGTH and “Pilot strength” of the *Provide Pilot Phase Measurement* message are used interchangeably in this document.

⁸ PILOT_SRENGTH and “Pilot strength” in “Pilot phase information” IE of the *Provide Pilot Phase Measurement* message are used interchangeably in this document.

⁹ LAT/LONG and “Latitude/Longitude” of the *Provide Pseudorange Measurement* message are used interchangeably in this document.

R_1	Lower limit for RMS error normalized by PS_RANGE_RMS_ER or “Pseudorange RMS Error” in <i>Provide Pseudorange Measurement</i> message ¹⁰ , or by RMS_ERR_PHASE or “RMS error in phase measurement” in <i>Provide Pilot Phase Measurement</i> message ¹¹ , or by “Pseudorange RMS Error” in <i>Provide GNSS Pseudorange Measurement</i> message, or by “Satellite Pseudodoppler RMS Error” in <i>Provide GNSS Pseudorange Measurement</i> message
R_2	Upper limit for RMS error normalized by PS_RANGE_RMS_ER or “Pseudorange RMS Error” in <i>Provide Pseudorange Measurement</i> message, or by RMS_ERR_PHASE or “RMS error in phase measurement” in <i>Provide Pilot Phase Measurement</i> message, or by “Pseudorange RMS Error” in <i>Provide GNSS Pseudorange Measurement</i> message, or by “Satellite Pseudodoppler RMS Error” in <i>Provide GNSS Pseudorange Measurement</i> message

1

2 Detailed description of the values listed in Table 1.6-1 is given in 1.6.1 through 1.6.2.2.

3 1.6.1 Evaluation of the Measurement Yield

4 Unless otherwise noted, the following general procedures apply:

- 5 1. A given test consists of a series of independent measurements.¹²
- 6 2. A measurement is declared a success if the mobile station returns at least N instances
7 of a designated parameter type within time period T_2 , where both N and T_2 are
8 specified for each test. The designated parameter type is LAT/LONG or
9 “Latitude/Longitude” in the *Provide Location Response* message, “Latitude/Longitude”
10 in the *Provide Advanced Location Response* message,
11 SV_CODE_PH_WH/SV_CODE_PH_FR or “Satellite code phase – whole chips/Satellite
12 code phase – fractional chips” in the *Provide Pseudorange Measurement* message, “Code
13 phase origin/Code phase” in the *Provide GNSS Pseudorange Measurement* message,

¹⁰ PS_RANGE_RMS_ER and “Pseudorange RMS Error” of the *Provide Pseudorange Measurement* message are used interchangeably in this document.

¹¹ RMS_ERR_PHASE and “RMS error in phase measurement” of the *Provide Pilot Phase Measurement* message are used interchangeably in this document.

¹² In this document, ‘measurement’, when used in the context of position location, means the process that normally leads to obtaining a single position fix. The parameters returned by the mobile station during the course of a measurement (satellite code phase values, for example) themselves are not called measurements; they are called parameters or parameter values instead.

1 and PILOT_PN_PHASE or “Pilot measured phase” in the *Provide Pilot Phase*
 2 *Measurement* message.¹³ A measurement is declared a failure if the mobile station
 3 returns M parameters, with $M < N$, within time period T_2 . The start of time period T_2
 4 is set as follows:

- 5 ▪ For Position Location Test Modes 1 and 2, the start of the time period is at the
 6 occurrence of the action evoking the position location session origination by the
 7 mobile station. (For example, pressing the last key in the sequence to start an
 8 emergency call.)
- 9 ▪ For Position Location Test Modes 3 and 4, the start of the time period is at the end of
 10 the transmission of the message containing the measurement request by the base
 11 station.

- 12 3. The designated parameter values returned by the mobile station, for which the mobile
 13 station indicated an error, are not counted towards N . See Table 1.6.2.1.1-1 for the list
 14 of error indications.
- 15 4. If the mobile station returns redundant information during a single measurement, i.e. it
 16 returns more than one LAT/LONG parameter or “Latitude/Longitude” parameter, or it
 17 returns more than one SV_CODE_PH_WH/SV_CODE_PH_FR parameter or “Satellite
 18 code phase – whole chips/Satellite code phase – fractional chips” parameter for the
 19 same satellite, or it returns more than one “Code phase origin/Code phase” parameter
 20 for the same satellite of a GNSS signal, or it returns more than one PILOT_PN_PHASE
 21 parameter or “Pilot measured phase” parameter for the same pilot, then only the first
 22 parameter for which the mobile station did not indicate an error will be counted
 23 towards N .

24 1.6.2 Evaluation of the returned parameters

25 The performance tests described in this document (i.e. all tests other than the protocol
 26 tests) require carrying out a statistical analysis of the parameter values returned by the
 27 mobile station. The statistical analysis is performed for each parameter type separately, on
 28 a subset of the returned values. The following will apply to the construction of these
 29 subsets:

¹³ The mobile station always returns the values of LAT and LONG or “Latitude” and “Longitude” as a pair, and these values are evaluated jointly by the procedures described in this document. These two pairs of values are both considered a single parameter in this document designated by LAT/LONG and “Latitude/Longitude”, respectively. Similarly, SV_CODE_PH_WH and SV_CODE_PH_FR, or “Satellite code phase – whole chips” and “Satellite code phase – fractional chips”, are also returned as a pair. These two pairs are also considered to be a single parameter designated by SV_CODE_PH_WH/SV_CODE_PH_FR and “Satellite code phase – whole chips/Satellite code phase – fractional chips”. Similarly, “Code phase origin” and “Code phase” are also returned as a pair. This pair is also considered to be a single parameter designated by “Code phase origin/Code phase”.

- 1 ▪ The parameter values returned by the mobile station, for which the mobile station
2 indicated an error, are excluded from the statistical evaluation. See Table 1.6.2.1.1-1
3 for the list of error indications.
- 4 ▪ If the mobile station returns redundant information during a single measurement, i.e.
5 it returns more than one *Provide Location Response*, or it returns more than one
6 *Provide Advanced Location Response*, or it returns more than one satellite code phase
7 record for the same satellite in *Provide Pseudorange Measurement* messages, or it
8 returns more than one satellite code phase record for the same satellite of a GNSS
9 signal in *Provide GNSS Pseudorange Measurement* messages, or it returns more than
10 one pilot phase record for the same pilot in *Provide Pilot Phase Measurement*
11 messages, then only the first message or record, for which the mobile station did not
12 indicate an error, will be included in the statistical evaluation. See Table 1.6.2.1.1-1
13 for the list of error indications.
- 14 ▪ The parameters returned by the mobile station after the expiration of specified time
15 period T_2 will be excluded from the evaluation.
- 16 ▪ If the mobile station returns more than N non-redundant parameters (i.e. parameters
17 corresponding to distinct satellites or base stations) within time period T_2 , then all
18 the returned parameters that have no error indications will be included in the
19 evaluation. See Table 1.6.2.1.1-1 for the list of error indications.

20 1.6.2.1 Evaluation with σ_1 , σ_2 and σ_1 , $\sigma_{80\%}$ Type Tests

21 For all tested data fields, except for the returned RMS error estimate, a σ_1 , σ_2 or σ_1 , $\sigma_{80\%}$
22 type test is performed. The σ_1 , σ_2 and σ_1 , $\sigma_{80\%}$ type tests comprise the following steps:

- 23 1. For each returned parameter, in each measurement, a non-negative error value ε is
24 determined. The calculation of this error value for successful measurements is
25 described in 1.6.2.1.1. For failed measurements, where M valid parameters were
26 returned within time period T_2 , with $M < N$, ε is set to any value greater than σ for
27 each of the $N - M$ missing parameters. For failed measurements in *Provide GNSS*
28 *Pseudorange Measurement* of GNSS dynamic range test σ is $\sigma_{80\%}$, the 80% point
29 defined below. For failed measurements other than those in *Provide GNSS Pseudorange*
30 *Measurement* of GNSS dynamic range test σ is σ_2 , the 95% point defined below.
- 31 2. If the mobile station returns parameter values corresponding to satellite or base station
32 signals that were not simulated during the measurement, then for those parameters,
33 the error is set to any value greater than σ . For parameters in *Provide GNSS*
34 *Pseudorange Measurement* of GNSS dynamic range test σ is $\sigma_{80\%}$, the 80% point
35 defined below. For parameters other than those in *Provide GNSS Pseudorange*
36 *Measurement* of GNSS dynamic range test σ is σ_2 , the 95% point defined below.
- 37 3. The mobile station is declared compliant with the minimum specification if the collected
38 measurement results establish $P(\varepsilon < \sigma_1) > 0.67$ and $P(\varepsilon < \sigma) > p$ with a given
39 confidence level for all tested parameter types; where threshold levels σ_1 and σ are

1 specified for each parameter type for a given test, and the confidence level will be 90%
2 unless otherwise stated. For parameters in *Provide GNSS Pseudorange Measurement* of
3 GNSS dynamic range test σ is $\sigma_{80\%}$ and $p = 0.8$. For parameters other than those in
4 *Provide GNSS Pseudorange Measurement* of GNSS dynamic range test σ is σ_2 and
5 $p = 0.95$. See Annex D for the description of the recommended method of statistical
6 evaluation.

7 Hereinafter, the test method described in this paragraph will be called a σ_1, σ_2 type test or
8 a $\sigma_1, \sigma_{80\%}$ type test.

9 1.6.2.1.1 Error Calculation

10 Unless specified otherwise, error ε is calculated as the absolute value of the difference
11 between the returned parameter value and the true parameter value. Whenever a given
12 parameter represents a vector (for example, horizontal position), the magnitude of the
13 vector difference is taken. True parameter value, in this context, means a best estimate of
14 the physical parameter value observable by the mobile station. The true value can be
15 generated by interpolating between reference data sample points provided by the test
16 equipment (for example, recorded reference SV-to-user range provided by the GPS and
17 GNSS simulators). Alternatively, the true value can be independently computed with an
18 appropriate algorithm, based on the test scenario parameters. These or other methods for
19 determining the true value are acceptable provided that all test equipment requirements
20 listed in 6 are met.

21 The returned parameter fields and corresponding error indications are listed in Table
22 1.6.2.1.1-1.

23

1

Table 1.6.2.1.1-1 Returned Parameter Fields and Corresponding Error Indications

MS Response	Returned Parameter Field	Error Indication	Note
<i>Provide Pseudorange Measurement</i>	SV_CODE_PH_WH	PS_RANGE_RMS_ER or “Pseudorange RMS error” = ‘111111’	See 1.6.2.1.1.1, 1.6.2.1.1.2
	SV_CODE_PH_FR		
	PS_DOPPLER	PS_RANGE_RMS_ER or “Pseudorange RMS error” = ‘111111’	See 1.6.2.1.1.3
	SV_CNO	PS_RANGE_RMS_ER or “Pseudorange RMS error” = ‘111111’	See 1.6.2.1.1.4
<i>Provide Pilot Phase Measurement</i>	PILOT_PN_PHASE	RMS_ERR_PHASE or “RMS error in phase measurement” = ‘111111’	See 1.6.2.1.1.5
	REF_PILOT_STRENGTH	RMS_ERR_PHASE or “RMS error in phase measurement” = ‘111111’	See 1.6.2.1.1.4
	TOTAL_RX_POWER	RMS_ERR_PHASE or “RMS error in phase measurement” = ‘111111’	See 1.6.2.1.1.4
	PILOT_STRENGTH	RMS_ERR_PHASE or “RMS error in phase measurement” = ‘111111’	See 1.6.2.1.1.4
<i>Provide Location Response</i>	LAT	LOC_UNCRTNTY_A or “Standard deviation of axis along angle specified for position uncertainty” = ‘11110’ or ‘11111’ or LOC_UNCRTNTY_P or “Standard deviation of axis perpendicular to angle specified for position uncertainty” = ‘11110’ or ‘11111’	See 1.6.2.1.1.6
	LONG		

<i>Provide GNSS Pseudorange Measurement</i>	Code Phase origin	Pseudorange RMS Error = '111111'	See 1.6.2.1.1.1, 1.6.2.1.1.2
	Code Phase		
	Satellite Pseudodoppler	Satellite Pseudodoppler RMS Error = '111111'	See 1.6.2.1.1.3
	Satellite C/No	Pseudorange RMS Error = '111111'	See 1.6.2.1.1.4
<i>Provide Advanced Location Response</i>	Latitude	Magnitude of error along angle specified for horizontal location uncertainty = '62' or '63' or Magnitude of error perpendicular to angle specified for horizontal location uncertainty = '62' or '63'	See 1.6.2.1.1.6
	Longitude		

1

2 1.6.2.1.1.1 Calculation of Absolute Satellite Code Phase Error

3 Satellite code phase values with error indications are discarded (see Table 1.6.2.1.1-1 for
4 the list of error indications).

5 The absolute satellite code phase error represents the mobile station's measurement quality
6 prior to the PDE operating on the measurements. This can also be referred to as the raw
7 performance. The relative satellite code phase error represents the consistency of values
8 returned for each satellite within a single measurement. The limits placed on the absolute
9 and relative satellite code phase errors, together, define a level of performance equivalent to
10 that defined by the LAT/LONG and 'Latitude/Longitude' requirements.

11 The absolute satellite code phase error $\delta_{i,j}$ is obtained as $\delta_{i,j} = |e_{i,j}|$, where for GPS tests

12 in sections other than 3, $e_{i,j}$ is defined as¹⁴
$$e_{i,j} = \begin{cases} \rho_{i,j} + 1023, & \text{if } \rho_{i,j} < -511 \\ \rho_{i,j} - 1023, & \text{if } \rho_{i,j} > 511 \\ \rho_{i,j} & , \text{ otherwise} \end{cases}$$
, with $\rho_{i,j}$

¹⁴ This definition accommodates for the periodic nature of the GPS C/A code. The C/A code sequence has a period of $2^{10}-1= 1023$ chips.

1 calculated as $\rho_{i,j} = \hat{r}_{i,j} - r_j(t_i) - C_{GPS} \cdot \left(-\frac{MSTO_i}{16 \cdot C_{CDMA}} + \Delta T\right)$, where $C_{GPS} = 1.023$ Mcps is the
 2 GPS C/A code chip rate, $C_{CDMA} = 1.2288$ Mcps is the CDMA chip rate, i is the measurement
 3 index, j is the satellite index, $\hat{r}_{i,j}$ is the satellite code phase value returned by the mobile
 4 station and $r_j(t_i)$ is the true satellite code phase value at GPS time t_i , where t_i is derived
 5 from the returned TIME_REF field (expressed in CDMA system time) corresponding to the
 6 measurement; $MSTO_i$ is the value of the MOB_SYS_T_OFFSET field reported by the mobile
 7 station for the i^{th} measurement, and ΔT is the independently measured base station to
 8 GPS simulator timing offset (see 6.6). An advance in base station system time relative to
 9 GPS simulator system time is represented by a positive ΔT value. If OFFSET_INCL is set
 10 to '0' by the mobile station, then $MSTO_i = 0$ assignment is used. For GNSS tests in 3, the
 11 absolute satellite code phase error $\delta_{i,j}$ is obtained as $\delta_{i,j} = |e_{i,j}|$ nanoseconds, where $e_{i,j}$ is
 12 defined as

$$13 \quad e_{i,j} = \begin{cases} \rho_{i,j} + 10^6, & \text{if } \rho_{i,j} < -5 \times 10^5 \\ \rho_{i,j} - 10^6, & \text{if } \rho_{i,j} > 5 \times 10^5 \\ \rho_{i,j}, & \text{otherwise} \end{cases}, \quad \text{with } \rho_{i,j} \text{ calculated as}$$

$$14 \quad \rho_{i,j} = \hat{r}_{i,j} - r_j(t_i) + \frac{MSTO_i \cdot 10^9}{16 \cdot C_{CDMA}} - \Delta T_{GNSS},$$

where $C_{CDMA} = 1.2288$ Mcps is the CDMA chip
 15 rate, where i is the measurement index, j is the satellite index, $\hat{r}_{i,j}$ is the satellite code
 16 phase value in nanoseconds returned by the mobile station and $r_j(t_i)$ is the true satellite
 17 code phase value in nanoseconds at reference time t_i , where t_i is derived from the
 18 returned 'Reference Time' field corresponding to the measurement. $MSTO_i$ is the value of
 19 the "Mobile station system time offset" field reported by the mobile station for the i^{th}
 20 measurement. ΔT_{GNSS} is the independently measured base station to GNSS simulator
 21 timing offset in nanoseconds (see 6.8). An advance in base station system time relative to
 22 GNSS simulator system time is represented by a positive ΔT_{GNSS} value.

23 Note, ΔT and ΔT_{GNSS} shown in the equations above represents a correction for a certain
 24 type of test equipment inaccuracy. Other inaccuracies (for example, unequal cable length
 25 connecting the mobile station to the GPS or GNSS simulator and the base station) may be
 26 corrected for in a similar fashion. However, if any or all of these corrections were already
 27 applied as part of the determination of the true parameter value, then those corrections
 28 shall not be applied here.

1 1.6.2.1.1.2 Calculation of Relative Satellite Code Phase Error

2 Satellite code phase values with error indications are discarded (see Table 1.6.2.1.1-1 for
3 the list of error indications). The relative satellite code phase error $\delta'_{i,j}$ is obtained as

4 $\delta'_{i,j} = |\tilde{e}_{i,j}|$, where $\tilde{e}_{i,j}$ is calculated as $\tilde{e}_{i,j} = e_{i,j} - \bar{e}_i$, where the $e_{i,j}$ are obtained as

5 explained above, and \bar{e}_i is the mean error, calculated as $\bar{e}_i = \frac{1}{l_i} \sum_{j=1}^{l_i} e_{i,j}$, where l_i is the

6 number of satellite code phase values returned by the mobile station for the i^{th}
7 measurement.

8 1.6.2.1.1.3 Calculation of Pseudo Doppler Error

9 Pseudo Doppler values with error indications are discarded (see Table 1.6.2.1.1-1 for the
10 list of error indications). The pseudo Doppler error $\gamma'_{i,j}$ is obtained as $\gamma'_{i,j} = |\tilde{d}_{i,j}|$; where

11 $\tilde{d}_{i,j}$ is calculated as $\tilde{d}_{i,j} = d_{i,j} - \bar{d}_i$, where $d_{i,j}$ is the difference between the returned
12 pseudo Doppler value and the true Doppler value at time t_i , where t_i is derived from the
13 returned TIME_REF field corresponding to the measurement; and \bar{d}_i is the mean error,

14 calculated as $\bar{d}_i = \frac{1}{l_i} \sum_{j=1}^{l_i} d_{i,j}$, where l_i is the number of pseudo Doppler values returned by
15 the mobile station for the i^{th} measurement.

16 1.6.2.1.1.4 Calculation of Signal-to-Noise Ratio and Signal Strength Errors

17 Signal-to-noise ratio and signal strength values with error indications are discarded (see
18 Table 1.6.2.1.1-1 for the list of error indications). Signal-to-noise ratio and signal strength
19 estimation errors are obtained as the absolute value of the difference between the reported
20 value and the true value, both expressed in units given by the corresponding field definition
21 of [1].

22 1.6.2.1.1.5 Calculation of Pilot Phase Error

23 Pilot phase values with error indications are discarded (see Table 1.6.2.1.1-1 for the list of
24 error indications). The pilot phase error $\mu_{i,j}$ is obtained as $\mu_{i,j} = |m_{i,j}|$, where $m_{i,j}$ is

25 defined as¹⁵ $m_{i,j} = \begin{cases} \zeta_{i,j} + 2^{15}, & \text{if } \zeta_{i,j} < -2^{14} \\ \zeta_{i,j} - 2^{15}, & \text{if } \zeta_{i,j} > 2^{14} \\ \zeta_{i,j}, & \text{otherwise} \end{cases}$, with $\zeta_{i,j}$ calculated as

26 $\zeta_{i,j} = \hat{p}_{i,j} - p_j(t_i) + MSTO_i / 16 - C_{CDMA} \cdot \Delta T_j$; where $C_{CDMA} = 1.2288$ Mcps is the CDMA chip

¹⁵ This definition accommodates for the periodic nature of the CDMA pilot PN code. The pilot PN code sequence has a period of $2^{15} = 32768$ chips.

1 rate, i is the measurement index, j is the base station index, $\hat{p}_{i,j}$ is the pilot phase value
 2 returned by the mobile station, and $p_j(t_i)$ is the true pilot phase value at time t_i , where t_i
 3 is the timestamp derived from the TIME_REF_MS field value for the i^{th} measurement;
 4 $MSTO_i$ is the value of the MOB_SYS_T_OFFSET field reported by the mobile station for the
 5 i^{th} measurement, and ΔT_j is the independently measured timing offset between base
 6 station j (whose pilot phase is being reported) and the serving base station (see 6.4.2). An
 7 advance in base station system time relative to the serving base station system time is
 8 represented by a positive ΔT_j value. If OFFSET_INCL is set to '0' by the mobile station,
 9 then $MSTO_i = 0$ assignment is used.

10 Note, ΔT_j shown in the equation above represents a correction for a certain type of test
 11 equipment inaccuracy. Other inaccuracies (for example, unequal cable length connecting
 12 the mobile station to the different base stations) may be corrected for in a similar fashion.
 13 However, if any or all of these corrections were already applied as part of the determination
 14 of the true parameter value, then those corrections shall not be applied here.

15 1.6.2.1.1.6 Calculation of Horizontal Position Error

16 Returned horizontal position values corresponding to Latitude and Longitude values that
 17 were indicated as erroneous by the mobile station according to Table 1.6.2.1.1-1 are not
 18 counted towards N and are discarded from the statistical evaluation. A horizontal position
 19 error is calculated as the magnitude of the difference vector between the reported and the
 20 nominal 2D positions, all expressed in units of 1 m.

21 1.6.2.2 Evaluation of the Returned RMS Error Estimates

22 The RMS error estimate returned by the mobile station is evaluated as follows:

23 1. All returned values for a given parameter type (satellite code phase or pilot phase),
 24 excluding the values for which there was an error indication, are collected during the i^{th}
 25 measurement to give $x_{i,1}, x_{i,2}, \dots, x_{i,l_i}$, where l_i is the total number of valid parameter
 26 values (satellite code phase or pilot phase) returned by the mobile station during the i^{th}
 27 measurement.

28 2. For each value $x_{i,j}$, an error value $\eta_{i,j}$ is calculated. For satellite code phase values,
 29 $\eta_{i,j}$ is assigned as $\eta_{i,j} = \tilde{e}_{i,j}$, while for pilot phase values, $\eta_{i,j}$ is assigned as
 30 $\eta_{i,j} = m_{i,j}$, where the $\tilde{e}_{i,j}$ and $m_{i,j}$ are calculated according to the description in
 31 1.6.2.1.1.

32 3. For each $\eta_{i,j}$, $\tilde{\eta}_{i,j}$ is calculated as $\tilde{\eta}_{i,j} = \eta_{i,j} - \bar{\eta}$, where $\bar{\eta}$ is the mean, calculated as

33
$$\bar{\eta} = \frac{1}{K} \sum_{i=1}^K \left(\frac{1}{l_i} \sum_{j=1}^{l_i} \eta_{i,j} \right),$$
 where K is the total number of measurements.

1 4. Each error value $\tilde{\eta}_{i,j}$ is normalized¹⁶ by dividing it with the corresponding RMS error
 2 estimate $RMS_{i,j}$ returned by the mobile station, to get $\eta'_{i,j} = \frac{\tilde{\eta}_{i,j}}{RMS_{i,j}}$. The returned
 3 RMS error estimate parameter fields and the corresponding error indications are listed
 4 in Table 1.6.2.2-1.

5
 6
 7

Table 1.6.2.2-1 Returned RMS Error Estimate Parameter Fields and Corresponding Error Indications

MS Response	Parameter Field	Error Indication
<i>Provide Pseudorange Measurement</i>	PS_RANGE_RMS_ER	PS_RANGE_RMS_ER = '111111'
<i>Provide Pilot Phase Measurement</i>	RMS_ERR_PHASE	RMS_ERR_PHASE = '111111'
<i>Provide GNSS Pseudorange Measurement</i>	Pseudorange RMS Error	Pseudorange RMS Error = '111111'
	Satellite Pseudodoppler RMS Error	Satellite Pseudodoppler RMS Error = '111111'

8

9 5. The average normalized RMS error R is calculated as $R = \sqrt{\frac{1}{K} \sum_{i=1}^K \left(\frac{1}{l_i} \sum_{j=1}^{l_i} \eta'_{i,j} \right)^2}$.

10 The mobile station is declared compliant with the minimum specification if $R_1 \leq R \leq R_2$ is
 11 satisfied, where threshold levels R_1 and R_2 are specified for each test.

¹⁶ The resulting random variable $\eta'_{i,j}$ would have unit variance with a perfect returned RMS error estimate.

1 **2 GPS MINIMUM SPECIFICATIONS**

2 The tests described in this section shall be performed for GPS capable mobile stations.
 3 GPS capable mobile stations may return *Provide Pseudorange Measurement* messages or
 4 *Provide Location Response* messages. For a mobile station that is capable of returning
 5 *Provide Pseudorange Measurement* messages, the parameter fields of that message will be
 6 tested. For a mobile station that is capable of returning *Provide Location Response*
 7 messages, the parameter fields of that message will be tested. The following comments
 8 apply to all GPS test cases:

- 9 ▪ The serving base station pilot PN offset corresponds directly to PILOT_PN in the *Sync*
 10 *Channel Message* and to REF_PN in the PDE simulator GPS assistance messages.
- 11 ▪ The serving base station power is set to $\hat{I}_{or} = -70$ dBm.
- 12 ▪ The simulated locations (not the actual physical locations) of the mobile station and
 13 the serving base station are as follows: In the stationary and protocol tests, the
 14 serving base station is due north from the mobile station at a distance of $5/\sqrt{3}$ km.
 15 In the moving scenario test, the mobile station's trajectory is circular in the horizontal
 16 plane, with a radius of 1 km centered at the serving base station location. See Annex
 17 B for detailed location data.
- 18 ▪ The limit values for each measurement parameter represent an interpretation of the
 19 returned values with the units stated and are not the actual returned binary values.

20 **2.1 GPS Performance Specifications**

21 The performance specifications described in this section set a minimum acceptable level of
 22 accuracy for the GPS based measurements returned by the mobile station under various
 23 test conditions.

24 2.1.1 Stationary Location Tests

25 In stationary location tests, the signal environment is set such that a stationary mobile
 26 station location is simulated.

27 2.1.1.1 GPS Accuracy Test

28 2.1.1.1.1 Definition

29 The purpose of this test is to determine the mobile station's capability to obtain precise GPS
 30 measurements under favorable signal conditions and good satellite geometry. The GPS
 31 simulator shall provide high SNR signals representing eight satellites with HDOP less than
 32 1.6. Note that the GPS assistance provided by the serving base station is not limited to
 33 eight satellites during this test. A sequence of independent measurements is carried out.
 34 In each measurement, the mobile station shall return a *Provide Location Response* message
 35 if the mobile station is capable of location computation; or it shall return one or more
 36 *Provide Pseudorange Measurement* messages if it is not capable of location computation.
 37 The test may be stopped when the required confidence levels are met for all tested
 38 parameters.

1 2.1.1.1.2 Method of Measurement

- 2 1. Connect a base station simulator and a GPS simulator to the mobile station as shown
 3 in Figure 6.12.1-1.
 4 2. For each band class that the mobile station supports, configure the mobile station to
 5 operate in that band class and perform steps 3 through 13.
 6 3. Configure the base station according to the standard test parameters listed in 6.12.2.
 7 4. Configure the GPS simulator according to the standard test parameters listed in Annex
 8 B.
 9 5. Set the GPS simulator output levels according to Table 2.1.1.1.2-1. Satellites not listed
 10 in Table 2.1.1.1.2-1 shall not be simulated.

11
 12 **Table 2.1.1.1.2-1 Satellite Signal Levels for the GPS Accuracy Test**

Satellite PRN Number	Signal Level (dBm)	C/N ₀ (dB-Hz)
3, 14, 15, 17, 18, 21, 29, 31	-130	44

- 13
 14 6. Measure and record the time offset between the base station and the GPS simulator
 15 time base (see 6.7).
 16 7. Repeat Steps 8 through 13.
 17 8. Power up the mobile station.
 18 9. Reset previous measurements, computed positions, values calculated during previous
 19 fixes and GPS system time.
 20 10. Initiate a mobile terminated voice call.
 21 11. Initiate a Test Mode 4 session.
 22 12. Record the values returned by the mobile station.
 23 13. Power down the mobile station.

24 2.1.1.1.3 Minimum Specification

25 The parameters returned by the mobile station shall satisfy the requirements listed in Table
 26 2.1.1.1.3-1; the confidence level for all σ_1 , σ_2 type tests shall be 90% (see also 1.6).

27

2

3 2.1.1.2 GPS Dynamic Range Test

4 2.1.1.2.1 Definition

5 The purpose of this test is to determine the mobile station's capability to obtain precise GPS
6 measurements under variable (strong to weak) signal conditions while stationary. The test
7 covers signal strength ranging from -125 dBm to -146 dBm. The GPS simulator shall
8 provide signals representing eight satellites with HDOP less than 1.6. Note that the GPS
9 assistance provided by the serving base station is not limited to eight satellites during this
10 test. A sequence of independent measurements is carried out. In each measurement, the
11 mobile station shall return a *Provide Location Response* message if the mobile station is
12 capable of location computation; or it shall return one or more *Provide Pseudorange*
13 *Measurement* messages if it is not capable of location computation. The test may be
14 stopped when the required confidence levels are met for all tested parameters.

1 2.1.1.2.2 Method of Measurement

- 2 1. Connect a base station simulator and a GPS simulator to the mobile station as shown
 3 in Figure 6.12.1-1.
- 4 2. For each band class that the mobile station supports, configure the mobile station to
 5 operate in that band class and perform steps 3 through 13.
- 6 3. Configure the base station according to the standard test parameters listed in 6.12.2.
- 7 4. Configure the GPS simulator according to the standard test parameters listed in Annex
 8 B.
- 9 5. Set the GPS simulator output levels according to Table 2.1.1.2.2-1. Satellites not listed
 10 in Table 2.1.1.2.2-1 shall not be simulated.

11

12 **Table 2.1.1.2.2-1 Satellite Signal Levels for the GPS Dynamic Range Test**

Satellite PRN Number	Signal Level (dBm)	C/N ₀ (dB-Hz)
3	-125	49
14	-128	46
15	-131	43
17	-134	40
29	-137	37
31	-140	34
21	-143	31
18	-149	25

13

- 14 6. Measure and record the time offset between the base station and the GPS simulator
 15 time base (see 6.7).
- 16 7. Repeat Steps 8 through 13.
- 17 8. Power up the mobile station.
- 18 9. Reset previous measurements, computed positions, values calculated during previous
 19 fixes and GPS system time.
- 20 10. Initiate a mobile terminated voice call.
- 21 11. Initiate a Test Mode 4 session.
- 22 12. Record the values returned by the mobile station.
- 23 13. Power down the mobile station.

1 2.1.1.2.3 Minimum Specification

2 The parameters returned by the mobile station shall satisfy the requirements listed in Table
 3 2.1.1.2.3-1; the confidence level for all σ_1 , σ_2 type tests shall be 90% (see also 1.6).

4

5 **Table 2.1.1.2.3-1 Minimum Specifications for the GPS Dynamic Range Test**

6

7 2.1.1.3 GPS Sensitivity Test

8 2.1.1.3.1 Definition

9 The purpose of this test is to determine the mobile station's capability to obtain GPS
 10 measurements under weak satellite signal conditions. The GPS simulator shall provide low
 11 SNR signals representing four satellites with HDOP less than 2.1. Note that the GPS
 12 assistance provided by the serving base station is not limited to four satellites during this
 13 test. A sequence of independent measurements is carried out. In each measurement, the
 14 mobile station shall return a *Provide Location Response* message if the mobile station is
 15 capable of location computation; or it shall return one or more *Provide Pseudorange*

1 *Measurement* messages if it is not capable of location computation. The test may be
 2 stopped when the required confidence levels are met for all tested parameters.

3 2.1.1.3.2 Method of Measurement

- 4 1. Connect a base station simulator and a GPS simulator to the mobile station as shown
 5 in Figure 6.12.1-1.
- 6 2. For each band class that the mobile station supports, configure the mobile station to
 7 operate in that band class and perform steps 3 through 13.
- 8 3. Configure the base station according to the standard test parameters listed in 6.12.2.
- 9 4. Configure the GPS simulator according to the standard test parameters listed in Annex
 10 B.
- 11 5. Set the GPS simulator output levels according to Table 2.1.1.3.2-1. Satellites not listed
 12 in Table 2.1.1.3.2-1 shall not be simulated.

13
 14 **Table 2.1.1.3.2-1 Satellite Signal Levels for the GPS Sensitivity Test**

Satellite PRN Number	Signal Level (dBm)	C/N ₀ (dB-Hz)
14, 17, 21, 31	-149	25

- 15
- 16 6. Measure and record the time offset between the base station and the GPS simulator
 17 time base (see 6.7).
- 18 7. Repeat Steps 8 through 13.
- 19 8. Power up the mobile station.
- 20 9. Reset previous measurements, computed positions, values calculated during previous
 21 fixes and GPS system time.
- 22 10. Initiate a mobile terminated voice call.
- 23 11. Initiate a Test Mode 4 session.
- 24 12. Record the values returned by the mobile station.
- 25 13. Power down the mobile station.

26 2.1.1.3.3 Minimum Specification

27 The parameters returned by the mobile station shall satisfy the requirements listed in Table
 28 2.1.1.3.3-1; the confidence level for all σ_1 , σ_2 type tests shall be 90% (see also 1.6).

29

3 2.1.1.4 GPS Multipath Accuracy Test

4 2.1.1.4.1 Definition

5 The purpose of this test is to determine the mobile station's capability to obtain precise GPS
6 measurements under a simple, two-ray GPS multipath environment and good satellite
7 geometry. The GPS simulator shall provide signals representing a total of five satellites
8 with HDOP less than 1.7. Two separate GPS signals shall be produced for three of the five
9 GPS satellites being simulated and presented to the mobile station under test, one
10 representing an attenuated, direct path and one representing a higher amplitude, delayed
11 multipath signal. Note that the GPS assistance provided by the serving base station is not
12 limited to five satellites during this test. A sequence of independent measurements is
13 carried out. In each measurement, the mobile station shall return a *Provide Location*
14 *Response* message if the mobile station is capable of location computation; or it shall return
15 one or more *Provide Pseudorange Measurement* messages if it is not capable of location

1 computation. The test may be stopped when the required confidence levels are met for all
 2 tested parameters.

3 2.1.1.4.2 Method of Measurement

- 4 1. Connect a base station simulator and a GPS simulator to the mobile station as shown
 5 in Figure 6.12.1-1.
- 6 2. For each band class that the mobile station supports, configure the mobile station to
 7 operate in that band class and perform steps 3 through 13.
- 8 3. Configure the base station according to the standard test parameters listed in 6.12.2.
- 9 4. Configure the GPS simulator according to the standard test parameters listed in Annex
 10 B. The Doppler shift of the multipath signal relative to the direct signal shall be in the
 11 range of 0.1 Hz t 0.5 Hz.
- 12 5. Set the GPS simulator output levels according to Table 2.1.1.4.2-1. Satellites not listed
 13 in Table 2.1.1.4.2-1 shall not be simulated.

14
 15 **Table 2.1.1.4.2-1 Satellite Signal Levels for the GPS Multipath Accuracy Test**

Satellite PRN Number	Signal Level (dBm)	C/N ₀ (dB-Hz)	Initial Delay (GPS Chips)
14, 17, 18	-144	30	0
14, 17, 18	-141	33	2
21, 31	-141	33	0

- 16
- 17 6. Measure and record the time offset between the base station and the GPS simulator
 18 time base (see 6.7).
- 19 7. Repeat Steps 8 through 13.
- 20 8. Power up the mobile station.
- 21 9. Reset previous measurements, computed positions, values calculated during previous
 22 fixes and GPS system time.
- 23 10. Initiate a mobile terminated voice call.
- 24 11. Initiate a Test Mode 4 session.
- 25 12. Record the values returned by the mobile station.
- 26 13. Power down the mobile station.

27 2.1.1.4.3 Minimum Specification

28 The parameters returned by the mobile station shall satisfy the requirements listed in Table
 29 2.1.1.4.3-1; the confidence level for all σ_1 , σ_2 type tests shall be 90% (see also 1.6).

1

4 2.1.2 Moving Scenario Test

5 2.1.2.1 Moving Scenario GPS Accuracy Test

6 2.1.2.1.1 Definition

7 The purpose of this test is to determine the mobile station's capability to obtain precise GPS
8 measurements under favorable signal conditions, when the mobile station is in motion.
9 The mobile station's trajectory is circular in the horizontal plane, with a radius of 1 km.
10 The mobile station's speed is constant at 100 km/h. The GPS simulator shall provide high
11 SNR signals representing eight satellites with HDOP less than 1.6. Note that the GPS
12 assistance provided by the serving base station is not limited to eight satellites during this
13 test. A sequence of independent measurements is carried out. In each measurement, the
14 mobile station shall return a *Provide Location Response* message if the mobile station is
15 capable of location computation; or it shall return one or more *Provide Pseudorange*

1 *Measurement* messages if it is not capable of location computation. The test may be
 2 stopped when the required confidence levels are met for all tested parameters.

3 2.1.2.1.2 Method of Measurement

- 4 1. Connect a base station simulator and a GPS simulator to the mobile station as shown
 5 in Figure 6.12.1-1.
- 6 2. For each band class that the mobile station supports, configure the mobile station to
 7 operate in that band class and perform steps 3 through 13.
- 8 3. Configure the base station according to the standard test parameters listed in 6.12.2.
- 9 4. Configure the GPS simulator according to the standard test parameters listed in Annex
 10 B.
- 11 5. Set the GPS simulator output levels according to Table 2.1.2.1.2-1. Satellites not listed
 12 in Table 2.1.2.1.2-1 shall not be simulated.

13
 14 **Table 2.1.2.1.2-1 Satellite Signal Levels for the Moving Scenario GPS Accuracy Test**

Satellite PRN Number	Signal Level (dBm)	C/No (dB-Hz)
3, 14, 15, 17, 18, 21, 29, 31	-130	44

- 15
- 16 6. Measure and record the time offset between the base station and the GPS simulator
 17 time base (see 6.7).
- 18 7. Repeat Steps 8 through 13.
- 19 8. Power up the mobile station.
- 20 9. Reset previous measurements, computed positions, values calculated during previous
 21 fixes and GPS system time.
- 22 10. Initiate a mobile terminated voice call.
- 23 11. Initiate a Test Mode 4 session.
- 24 12. Record the values returned by the mobile station.
- 25 13. Power down the mobile station.

26 2.1.2.1.3 Minimum Specification

27 The parameters returned by the mobile station shall satisfy the requirements listed in Table
 28 2.1.2.1.3-1; the confidence level for all σ_1 , σ_2 type tests shall be 90% (see also 1.6).

29

1 **Table 2.1.2.1.3-1 Minimum Specifications for the Moving Scenario GPS Accuracy Test**

3 **2.2 GPS Protocol Tests**

4 The protocol tests presented in this section shall be performed if the tests listed in 4.3
5 (AFLT Protocol Tests) are not performed.

6 **2.2.1 GPS Position Location Session on the Paging Channel Test**7 **2.2.1.1 Definition**

8 The purpose of this test is to determine the mobile station's capability to operate in a mode
9 when the base station initiates a position location session on the Paging Channel.

10 **2.2.1.2 Method of Measurement**

- 11 1. Connect a base station simulator and a GPS simulator to the mobile station as shown
12 in Figure 6.12.1-1.
- 13 2. Configure the mobile station to operate in a band class it supports.

- 1 3. Configure the base station according to the standard test parameters listed in 6.12.2.
- 2 4. Configure the GPS simulator according to the standard test parameters listed in Annex
- 3 B.
- 4 5. Set the GPS simulator output levels according to Table 2.2.1.2-1. Satellites not listed in
- 5 Table 2.2.1.2-1 shall not be simulated.

6
7

Table 2.2.1.2-1 Satellite Signal Levels for the Protocol Tests

Satellite PRN Number	Signal Level (dBm)	C/No (dB-Hz)
3, 14, 15, 17, 18, 21, 29, 31	-130	44

8

- 9 6. Power up the mobile station.
- 10 7. Reset previous measurements, computed positions, values calculated during previous
- 11 fixes and GPS system time.
- 12 8. Initiate a mobile terminated voice call.
- 13 9. Initiate a Test Mode 3 session.
- 14 10. Record the values returned by the mobile station.
- 15 11. Power down the mobile station.

16 2.2.1.3 Minimum Specification

17 The mobile station shall respond to base station requests received on the Paging Channel
 18 and it shall complete the position location session by returning a *Provide Location Response*
 19 message if the mobile station is capable of location computation; or it shall return one or
 20 more *Provide Pseudorange Measurement* messages if it is not capable of location
 21 computation. The parameters returned by the mobile station shall satisfy the requirements
 22 listed in Table 2.2.1.3-1 (see also 1.6).

23

Table 2.2.1.3-1 Minimum Specifications for the GPS Position Location Session on the Paging Channel Test

Mobile Station Response	Parameter Field	Limit Parameter	Limit Value
<i>Provide Pseudorange Measurement</i>	SV_CODE_PH_WH	N	4
	SV_CODE_PH_FR	T_2	16 s
<i>Provide Location Response</i>	LAT	N	1
	LONG	T_2	16 s

2.2.2 Mobile Station Originated GPS Position Location Session Test

These tests shall only be applied to mobile stations that support mobile station originated position location sessions.

2.2.2.1 Access Channel Test

2.2.2.1.1 Definition

This test shall be only applied to mobile stations that support position location session origination on the Access Channel. The purpose of this test is to determine the mobile station's capability to operate in a mode where the position location session is originated by the mobile station

2.2.2.1.2 Method of Measurement

1. Connect a base station simulator and a GPS simulator to the mobile station as shown in Figure 6.12.1-1.
2. Configure the mobile station to operate in a band class it supports.
3. Configure the base station according to the standard test parameters listed in 6.12.2.
4. Configure the GPS simulator according to the standard test parameters listed in Annex B.
5. Set the GPS simulator output levels according to Table 2.2.1.2-1. Satellites not listed in Table 2.2.1.2-1 shall not be simulated.
6. Power up the mobile station.
7. Reset previous measurements, computed positions, values calculated during previous fixes and GPS system time.
8. Initiate a Test Mode 1 session.
9. Record the values returned by the mobile station or the computed location stored in the mobile station.
10. Power down the mobile station.

1 2.2.2.1.3 Minimum Specification

2 The mobile station shall complete the position location session by returning one or more
 3 *Provide Pseudorange Measurement* messages if it is not capable of location computation or
 4 by computing its own location otherwise.

5 Note, if the mobile station is capable of location computation, it may return neither
 6 pseudorange measurement values nor the calculated position during this test. In this case
 7 the calculated position shall be retrieved from the mobile station by other means (for
 8 example, through the data port).

9 The parameters returned or computed by the mobile station shall satisfy the requirements
 10 listed in Table 2.2.2.1.3-1 (see also 1.6).

11 Note, time limit T_2 applies to the measurement time period that starts when the position
 12 location session is invoked at the mobile station.

13

14 **Table 2.2.2.1.3-1 Minimum Specifications for the Mobile Station Originated GPS**
 15 **Position Location Session Tests**

Mobile Station Response	Parameter Field	Limit Parameter	Limit Value
<i>Provide Pseudorange Measurement</i>	SV_CODE_PH_WH	N	4
	SV_CODE_PH_FR	T_2	16 s
Computed Mobile Station Location	N/A	N	1
		T_2	16 s

16

17 2.2.2.2 Dedicated Channel Test

18 2.2.2.2.1 Definition

19 This test shall only be applied to mobile stations that support position location session
 20 origination on a dedicated channel. The purpose of this test is to determine the mobile
 21 station's capability to operate in a mode where the position location session is originated by
 22 the mobile station

23 2.2.2.2.2 Method of Measurement

- 24 1. Connect a base station simulator and a GPS simulator to the mobile station as shown
 25 in Figure 6.12.1-1.
- 26 2. Configure the mobile station to operate in a band class it supports.
- 27 3. Configure the base station according to the standard test parameters listed in 6.12.2.
- 28 4. Configure the GPS simulator according to the standard test parameters listed in Annex
 29 B.

- 1 5. Set the GPS simulator output levels according to Table 2.2.1.2-1. Satellites not listed in
2 Table 2.2.1.2-1 shall not be simulated.
- 3 6. Power up the mobile station.
- 4 7. Reset previous measurements, computed positions, values calculated during previous
5 fixes and GPS system time.
- 6 8. Set up a mobile station originated voice call.
- 7 9. Initiate a Test Mode 2 session.
- 8 10. Record the values returned by the mobile station or the computed location stored in the
9 mobile station
- 10 11. Power down the mobile station

11 2.2.2.2.3 Minimum Specification

12 The mobile station shall complete the position location session by returning one or more
13 *Provide Pseudorange Measurement* messages if it is not capable of location computation or
14 by computing its own location otherwise.

15 Note, if the mobile station is capable of location computation, it may return neither
16 pseudorange measurement values nor the calculated position during this test. In this case
17 the calculated position shall be retrieved from the mobile station by other means (for
18 example, through the data port).

19 The parameters returned or computed by the mobile station shall satisfy the requirements
20 listed in Table 2.2.2.1.3-1 (see also 1.6).

21 Note, time limit T_2 applies to the measurement time period that starts at invoking the
22 position location session at the mobile station.

23

24

- 1 This page intentionally left blank.

1 **3 GNSS MINIMUM SPECIFICATIONS**

2 The tests described in this section shall be performed for GNSS capable mobile stations.
 3 GNSS capable mobile stations may return *Provide GNSS Pseudorange Measurement*
 4 messages or *Provide Advanced Location Response* messages. For a mobile station that is
 5 capable of returning *Provide GNSS Pseudorange Measurement* messages, the parameter
 6 fields of that message will be tested. For a mobile station that is capable of returning
 7 *Provide Advanced Location Response* messages, the parameter fields of that message will be
 8 tested. The following comments apply to all GNSS test cases:

- 9 ▪ The serving base station pilot PN offset corresponds directly to PILOT_PN in the *Sync*
 10 *Channel Message* and to “Pilot PN sequence offset” and “Reference PN” in the PDE
 11 simulator GNSS assistance messages.
- 12 ▪ The serving base station power is set to $\hat{I}_{or} = -70$ dBm.
- 13 ▪ The simulated locations (not the actual physical locations) of the mobile station and
 14 the serving base station are as follows: In the stationary and protocol tests, the
 15 serving base station is due north from the mobile station at a distance of $5/\sqrt{3}$ km.
 16 In the moving scenario test, the mobile station’s trajectory is circular in the horizontal
 17 plane, with a radius of 1 km centered at the serving base station location. See Annex
 18 C for detailed location data.
- 19 ▪ The limit values for each measurement parameter represent an interpretation of the
 20 returned values with the units stated and are not the actual returned binary values.

21 **3.1 GNSS Performance Specifications**

22 The performance specifications described in this section set a minimum acceptable level of
 23 accuracy for the GNSS based measurements returned by the mobile station under various
 24 test conditions.

25 All signals per the supported GNSS are simulated with relative signal power according to
 26 Table 3-1. The reference power levels are defined in each test.

27 **Table 3-1 Relative Signal Power Levels for Various Signal Types**

	Galileo		GPS/Modernize d GPS		GLONASS		QZSS		SBAS	
Signal power level relative to reference power levels (dB)	E1	0	L1 C/A	0	G1	0	L1 C/A	0	L1	0
	E6	+2	L1C	+1.5	G2	-6	L1C	+1.5		
	E5	+2	L2C	-1.5			L2C	-1.5		
			L5	+3.6			L5	+3.6		

1 3.1.1 Stationary Location Tests

2 In stationary location tests, the signal environment is set such that a stationary mobile
3 station location is simulated.

4 3.1.1.1 GNSS Accuracy Test

5 3.1.1.1.1 Definition

6 The purpose of this test is to determine the mobile station's capability to obtain precise
7 GNSS measurements under favorable signal conditions and good satellite geometry. The
8 GNSS simulator shall provide high SNR signals representing six or seven satellites with
9 HDOP between 1.4 and 2.1. Note that the GNSS assistance provided by the serving base
10 station is not limited to six or seven satellites during this test. A sequence of independent
11 measurements is carried out. In each measurement, the mobile station shall return a
12 *Provide Advanced Location Response* message if the mobile station is capable of location
13 computation; or it shall return one or more *Provide GNSS Pseudorange Measurement*
14 messages if it is not capable of location computation. The test may be stopped when the
15 required confidence levels are met for all tested parameters.

16 3.1.1.1.2 Method of Measurement

- 17 1. Connect a base station simulator and a GNSS simulator to the mobile station as shown
18 in Figure 6.12.1-4.
- 19 2. For each band class that the mobile station supports, configure the mobile station to
20 operate in that band class and perform steps 3 through 13.
- 21 3. Configure the base station according to the standard test parameters listed in 6.12.2.
- 22 4. Configure the GNSS simulator according to the standard test parameters listed in
23 Annex C.
- 24 5. Set the GNSS simulator output levels according to Table 3.1.1.1.2-1 and Table
25 3.1.1.1.2-2. Satellites not listed in Table 3.1.1.1.2-1 and Table 3.1.1.1.2-2 shall not be
26 simulated.

27

Table 3.1.1.1.2-1 Satellite Signal Levels for the GNSS Accuracy Test

System	Parameters	Unit	Value
	Number of generated satellites per system	-	See Table 3.1.1.1.2-2
	Total number of generated satellites	-	6 or 7 ⁽²⁾
	HDOP Range	-	1.4 to 2.1
	Propagation conditions	-	AWGN
GPS ⁽¹⁾	Reference signal power level for all satellites	dBm	-128.5
Galileo	Reference signal power level for all satellites	dBm	-127
GLONASS	Reference signal power level for all satellites	dBm	-131
QZSS ⁽³⁾	Reference signal power level for all satellites	dBm	-128.5
SBAS ⁽⁴⁾	Reference signal power level for all satellites	dBm	-131
NOTE 1: "GPS" means GPS L1 C/A, Modernized GPS, or both, dependent on the MS capabilities			
NOTE 2: 7 satellites applies only for SBAS case			
NOTE 3: If QZSS is supported, one of the GPS satellites is replaced by a QZSS satellite with respective signal support			
NOTE 4: If SBAS is supported, the SBAS satellite with the highest elevation is added to the scenario			

2

Table 3.1.1.1.2-2 Satellite Allocation for the GNSS Accuracy Test

	Satellite allocation for each constellation			
	GNSS 1⁽¹⁾	GNSS 2⁽¹⁾	GNSS 3⁽¹⁾	SBAS
Single constellation	6	-	-	1
Dual constellation	3	3	-	1
Triple constellation	2	2	2	1
NOTE1: GNSS refers to global systems, i.e., GPS, Galileo, GLONASS				

4

5 6. Measure and record the time offset between the base station and the GNSS simulator
6 time base (see 6.8).

7 7. Repeat Steps 8 through 13.

8 8. Power up the mobile station.

1 9. Reset previous measurements, computed positions, values calculated during previous
2 fixes and GNSS system time.

3 10. Initiate a mobile originated or terminated voice call for the measurement domain test
4 and a mobile originated voice call for the position domain test.

5 11. Initiate a Test Mode 2 or 4 session for the measurement domain test and a Test Mode 2
6 session for the position domain test.

7 12. Record the values returned by the mobile station.

8 13. Power down the mobile station.

9 3.1.1.1.3 Minimum Specification

10 The parameters returned by the mobile station shall satisfy the requirements listed in Table
11 3.1.1.1.3-1; the confidence level for all σ_1 , σ_2 type tests shall be 90% (see also 1.6).

12

3 3.1.1.2 GNSS Dynamic Range Test

4 3.1.1.2.1 Definition

5 The purpose of this test is to determine the mobile station's capability to obtain precise
6 GNSS measurements under variable (strong to weak) signal conditions while stationary.
7 The GNSS simulator shall provide signals representing six satellites with HDOP between
8 1.4 and 2.1. Note that the GNSS assistance provided by the serving base station is not
9 limited to six satellites during this test. A sequence of independent measurements is
10 carried out. In each measurement, the mobile station shall return a *Provide Advanced*
11 *Location Response* message if the mobile station is capable of location computation; or it
12 shall return one or more *Provide GNSS Pseudorange Measurement* messages if it is not
13 capable of location computation. The test may be stopped when the required confidence
14 levels are met for all tested parameters.

1 3.1.1.2.2 Method of Measurement

- 2 1. Connect a base station simulator and a GNSS simulator to the mobile station as shown
3 in Figure 6.12.1-4.
- 4 2. For each band class that the mobile station supports, configure the mobile station to
5 operate in that band class and perform steps 3 through 13.
- 6 3. Configure the base station according to the standard test parameters listed in 6.12.2.
- 7 4. Configure the GNSS simulator according to the standard test parameters listed in
8 Annex C.
- 9 5. Set the GNSS simulator output levels according to Table 3.1.1.2.2-1 and Table
10 3.1.1.2.2-2. Satellites not listed in Table 3.1.1.2.2-1 and Table 3.1.1.2.2-2 shall not be
11 simulated.

12

1 **Table 3.1.1.2.2-1 Satellite Signal Levels for the GNSS Dynamic Range Test**

System	Parameters	Unit	Value
	Number of generated satellites per system	-	See Table 3.1.1.2.2-2
	Total number of generated satellites	-	6
	HDOP Range	-	1.4 to 2.1
	Propagation conditions	-	AWGN
GPS ⁽¹⁾	Reference high signal power level	dBm	-129
	Reference low signal power level	dBm	-149
Galileo	Reference high signal power level	dBm	-127.5
	Reference low signal power level	dBm	-149
GLONASS	Reference high signal power level	dBm	-131.5
	Reference low signal power level	dBm	-149
NOTE 1: "GPS" means GPS L1 C/A, Modernized GPS, or both, dependent on the MS capabilities

Single constellation	High signal level	2	-	-
	Low signal level	4	-	-
Dual constellation	High signal level	1	1	-
	Low signal level	2	2	-
Triple constellation	High signal level	1	1	1
	Low signal level	1	1	1
NOTE1: GNSS refers to global systems, i.e., GPS, Galileo, GLONASS				

4

5 6. Measure and record the time offset between the base station and the GNSS simulator
6 time base (see 6.8).

7 7. Repeat Steps 8 through 13.

8 8. Power up the mobile station.

9 9. Reset previous measurements, computed positions, values calculated during previous
10 fixes and GNSS system time.

- 1 10. Initiate a mobile originated or terminated voice call for the measurement domain test
- 2 and a mobile originated voice call for the position domain test.
- 3 11. Initiate a Test Mode 2 or 4 session for the measurement domain test and a Test Mode 2
- 4 session for the position domain test.
- 5 12. Record the values returned by the mobile station.
- 6 13. Power down the mobile station.

7 3.1.1.2.3 Minimum Specification

8 The parameters returned by the mobile station shall satisfy the requirements listed in Table
 9 3.1.1.2.3-1; the confidence level for all σ_1 , σ_2 type tests in position domain and σ_1 , $\sigma_{80\%}$
 10 type tests in measurement domain shall be 90% (see also 1.6).

11
 12 **Table 3.1.1.2.3-1 Minimum Specifications for the GNSS Dynamic Range Test**

Mobile Station Response	Parameter Field	Limit Parameter	Limit Value
<i>Provide GNSS Pseudorange Measurement</i>	Code Phase Origin	N	6

1 3.1.1.3 GNSS Sensitivity Test

2 3.1.1.3.1 Definition

3 The purpose of this test is to determine the mobile station's capability to obtain GNSS
4 measurements under weak satellite signal conditions. The GNSS simulator shall provide
5 low SNR signals representing six satellites with HDOP between 1.4 and 2.1. Note that the
6 GNSS assistance provided by the serving base station is not limited to six satellites during
7 this test. A sequence of independent measurements is carried out. In each measurement,
8 the mobile station shall return a *Provide Advanced Location Response* message if the mobile
9 station is capable of location computation; or it shall return one or more *Provide GNSS*
10 *Pseudorange Measurement* messages if it is not capable of location computation. The test
11 may be stopped when the required confidence levels are met for all tested parameters.

12 3.1.1.3.2 Method of Measurement

- 13 1. Connect a base station simulator and a GNSS simulator to the mobile station as shown
14 in Figure 6.12.1-4.
- 15 2. For each band class that the mobile station supports, configure the mobile station to
16 operate in that band class and perform steps 3 through 13.
- 17 3. Configure the base station according to the standard test parameters listed in 6.12.2.
- 18 4. Configure the GNSS simulator according to the standard test parameters listed in
19 Annex C.
- 20 5. Set the GNSS simulator output levels according to Table 3.1.1.3.2-1 and Table
21 3.1.1.3.2-2. Satellites not listed in Table 3.1.1.3.2-1 and Table 3.1.1.3.2-2 shall not be
22 simulated.

23

1 **Table 3.1.1.3.2-1 Satellite Signal Levels for the GNSS Sensitivity Test**

System	Parameters	Unit	Value
	Number of generated satellites per system	-	See Table 3.1.1.3.2-2
	Total number of generated satellites	-	6
	HDOP Range	-	1.4 to 2.1
	Propagation conditions	-	AWGN
GPS ⁽¹⁾	Reference signal power level for all satellites	dBm	-149
Galileo	Reference signal power level for all satellites	dBm	-149
GLONASS	Reference signal power level for all satellites	dBm	-149
NOTE 1: "GPS" means GPS L1 C/A, Modernized GPS, or both, dependent on the MS capabilities

4

5 6. Measure and record the time offset between the base station and the GNSS simulator
6 time base (see 6.8).

7 7. Repeat Steps 8 through 13.

8 8. Power up the mobile station.

9 9. Reset previous measurements, computed positions, values calculated during previous
10 fixes and GNSS system time.

11 10. Initiate a mobile originated or terminated voice call for the measurement domain test
12 and a mobile originated voice call for the position domain test.

13 11. Initiate a Test Mode 2 or 4 session for the measurement domain test and a Test Mode 2
14 session for the position domain test.

15 12. Record the values returned by the mobile station.

16 13. Power down the mobile station.

1 3.1.1.3.3 Minimum Specification

2 The parameters returned by the mobile station shall satisfy the requirements listed in Table
 3 3.1.1.3.3-1; the confidence level for all σ_1 , σ_2 type tests shall be 90% (see also 1.6).

4

5 **Table 3.1.1.3.3-1 Minimum Specifications for the GNSS Sensitivity Test**

7 3.1.1.4 GNSS Multipath Accuracy Test

8 3.1.1.4.1 Definition

9 The purpose of this test is to determine the mobile station's capability to obtain precise
 10 GNSS measurements under a simple, two-ray GNSS multipath environment and good
 11 satellite geometry. The GNSS simulator shall provide signals representing a total of six
 12 satellites with HDOP between 1.4 and 2.1. Two separate GNSS signals shall be produced
 13 for three or four of the six GNSS satellites being simulated and presented to the mobile

1 station under test, one representing an attenuated, direct path and one representing a
2 higher amplitude, delayed multipath signal. Note that the GNSS assistance provided by the
3 serving base station is not limited to six satellites during this test. A sequence of
4 independent measurements is carried out. In each measurement, the mobile station shall
5 return a *Provide Advanced Location Response* message if the mobile station is capable of
6 location computation; or it shall return one or more *Provide GNSS Pseudorange*
7 *Measurement* messages if it is not capable of location computation. The test may be
8 stopped when the required confidence levels are met for all tested parameters.

9 3.1.1.4.2 Method of Measurement

- 10 1. Connect a base station simulator and a GNSS simulator to the mobile station as shown
11 in Figure 6.12.1-4.
- 12 2. For each band class that the mobile station supports, configure the mobile station to
13 operate in that band class and perform steps 3 through 13.
- 14 3. Configure the base station according to the standard test parameters listed in 6.12.2.
- 15 4. Configure the GNSS simulator according to the standard test parameters listed in
16 Annex C. The Doppler shift of the multipath signal relative to the direct signal shall be
17 in the range of 0.1 Hz to 0.5 Hz.
- 18 5. Set the GNSS simulator output levels according to Table 2.1.1.4.2-1 and Table
19 3.1.1.4.2-2. Satellites not listed in Table 2.1.1.4.2-1 and Table 3.1.1.4.2-2 shall not be
20 simulated.

21

1 **Table 3.1.1.4.2-1 Satellite Signal Levels for the GNSS Multipath Accuracy Test**

System	Parameters	Unit	Value
	Number of generated satellites per system	-	See Table 3.1.1.4.2-2
	Total number of generated satellites	-	6
	HDOP Range	-	1.4 to 2.1
	Propagation conditions	-	AWGN
GPS ⁽¹⁾	Reference LOS signal power level	dBm	-147
	Reference Multipath ⁽²⁾ signal power level	dBm	-144
Galileo	Reference LOS signal power level	dBm	-147
	Reference Multipath ⁽²⁾ signal power level	dBm	-144
GLONASS	Reference LOS signal power level	dBm	-147
	Reference Multipath ⁽²⁾ signal power level	dBm	-144
NOTE 1: "GPS" means GPS L1 C/A, Modernized GPS, or both, dependent on the MS capabilities			
NOTE 2: The multipath signal is delayed by 2 GNSS chips initially from the LOS signal for each individual GNSS signal, i.e., GPS L1 C/A, Galileo E1 or GLONASS G1, etc.			

2

3 **Table 3.1.1.4.2-2 Satellite Allocation for the GNSS Multipath Accuracy Test**

		Satellite allocation for each constellation		
		GNSS 1 ⁽¹⁾	GNSS 2 ⁽¹⁾	GNSS 3 ⁽¹⁾
Single constellation	LOS-only SVs	2	-	-
	SVs with LOS & Multipath	4	-	-
Dual constellation	LOS-only SVs	1	1	-
	SVs with LOS & Multipath	2	2	-
Triple constellation	LOS-only SVs	1	1	1
	SVs with LOS & Multipath	1	1	1
NOTE1: GNSS refers to global systems, i.e., GPS, Galileo, GLONASS				

4 6. Measure and record the time offset between the base station and the GNSS simulator
 5 time base (see 6.8).

6 7. Repeat Steps 8 through 13.

- 1 8. Power up the mobile station.
 - 2 9. Reset previous measurements, computed positions, values calculated during previous
 - 3 fixes and GNSS system time.
 - 4 10. Initiate a mobile originated or terminated voice call for the measurement domain test
 - 5 and a mobile originated voice call for the position domain test.
 - 6 11. Initiate a Test Mode 2 or 4 session for the measurement domain test and a Test Mode 2
 - 7 session for the position domain test.
 - 8 12. Record the values returned by the mobile station.
 - 9 13. Power down the mobile station.
- 10 3.1.1.4.3 Minimum Specification
- 11 The parameters returned by the mobile station shall satisfy the requirements listed in Table
- 12 3.1.1.4.3-1; the confidence level for all σ_1 , σ_2 type tests shall be 90% (see also 1.6).
- 13

3 3.1.2 Moving Scenario Test

4 3.1.2.1 Moving Scenario GNSS Accuracy Test

5 3.1.2.1.1 Definition

6 The purpose of this test is to determine the mobile station's capability to obtain precise
7 GNSS measurements under favorable signal conditions, when the mobile station is in
8 motion. The mobile station's trajectory is circular in the horizontal plane, with a radius of
9 1 km. The mobile station's speed is constant at 100 km/h. The GNSS simulator shall
10 provide high SNR signals representing six satellites with HDOP between 1.4 and 2.1. Note
11 that the GNSS assistance provided by the serving base station is not limited to six satellites
12 during this test. A sequence of independent measurements is carried out. In each
13 measurement, the mobile station shall return a *Provide Advanced Location Response*
14 message if the mobile station is capable of location computation; or it shall return one or

1 more *Provide GNSS Pseudorange Measurement* messages if it is not capable of location
2 computation. The test may be stopped when the required confidence levels are met for all
3 tested parameters.

4 3.1.2.1.2 Method of Measurement

- 5 1. Connect a base station simulator and a GNSS simulator to the mobile station as shown
6 in Figure 6.12.1-4.
- 7 2. For each band class that the mobile station supports, configure the mobile station to
8 operate in that band class and perform steps 3 through 13.
- 9 3. Configure the base station according to the standard test parameters listed in 6.12.2.
- 10 4. Configure the GNSS simulator according to the standard test parameters listed in
11 Annex C.
- 12 5. Set the GNSS simulator output levels according to Table 3.1.2.1.2-1 and Table
13 3.1.2.1.2-2. Satellites not listed in Table 3.1.2.1.2-1 and Table 3.1.2.1.2-2 shall not be
14 simulated.

1

2 **Table 3.1.2.1.2-1 Satellite Signal Levels for the Moving Scenario GNSS Accuracy Test**

System	Parameters	Unit	Value
	Number of generated satellites per system	-	See Table 3.1.2.1.2-2
	Total number of generated satellites	-	6
	HDOP Range	-	1.4 to 2.1
	Propagation conditions	-	AWGN
GPS ⁽¹⁾	Reference signal power level for all satellites	dBm	-128.5
Galileo	Reference signal power level for all satellites	dBm	-127
GLONASS	Reference signal power level for all satellites	dBm	-131
NOTE 1: "GPS" means GPS L1 C/A, Modernized GPS, or both, dependent on the MS capabilities			

3

4 **Table 3.1.2.1.2-2 Satellite Allocation for the Moving Scenario GNSS Accuracy Test**

	Satellite allocation for each constellation		
	GNSS 1⁽¹⁾	GNSS 2⁽¹⁾	GNSS 3⁽¹⁾
Single constellation	6	-	-
Dual constellation	3	3	-
Triple constellation	2	2	2
NOTE1: GNSS refers to global systems, i.e., GPS, Galileo, GLONASS			

5 6. Measure and record the time offset between the base station and the GNSS simulator
6 time base (see 6.8).

7 7. Repeat Steps 8 through 13.

8 8. Power up the mobile station.

9 9. Reset previous measurements, computed positions, values calculated during previous
10 fixes and GNSS system time.

11 10. Initiate a mobile originated or terminated voice call for the measurement domain test
12 and a mobile originated voice call for the position domain test.

13 11. Initiate a Test Mode 2 or 4 session for the measurement domain test and a Test Mode 2
14 session for the position domain test.

15 12. Record the values returned by the mobile station.

16 13. Power down the mobile station.

1 3.1.2.1.3 Minimum Specification

2 The parameters returned by the mobile station shall satisfy the requirements listed in Table
 3 3.1.2.1.3-1; the confidence level for all σ_1 , σ_2 type tests shall be 90% (see also 1.6).

4

5 **Table 3.1.2.1.3-1 Minimum Specifications for the Moving Scenario GNSS Accuracy**

7

4 AFLT MINIMUM SPECIFICATION

The tests described in this section shall be performed for AFLT capable mobile stations.

4.1 General Comments on AFLT Tests

The following comments apply to all AFLT test cases:

- AFLT tests only reflect 2D location processing.
- Only cases where three base stations (base station 1, 2 and 3) can be observed by the mobile station are examined.
- Although the *Provide Pilot Phase Measurement* message specified in [1] enables the mobile station to simultaneously report pilot phase measurements for more than one CDMA frequency or Band Class, the tests included in this Specification do not cover that capability.
- AFLT tests are described as using base stations or base station simulators, but it is understood that equivalent pilot generators for the non-serving base stations may be used.
- No handoff scenario tests are included, the serving base station is always base station 1.
- For all AFLT tests, base station 1 pilot PN offset is P_0 , base station 2 pilot PN offset is P_1 and base station 3 PN offset is P_2 , where P_0 , P_1 and P_2 are arbitrary values satisfying the requirements listed in 6.12.2. Furthermore, P_0 corresponds to PILOT_PN in the *Sync Channel Message*, while P_1 and P_2 correspond to the appropriate values in both the *General Neighbor List Message* (see Table 6.12.2-4) and the PDE simulator *Provide Base Station Almanac* message.
- For all AFLT tests, the simulated locations (not the actual physical locations) of the mobile station and the base stations are as follows: The three base stations form an equilateral triangle with the mobile station being at the geometric center of the triangle. Each base station is at a distance of 5 km from every other base station; thus, the mobile station is at a distance of $5/\sqrt{3}$ km from each base station. Base station 1 is due north from the mobile station, and base station 2 is southeast from the mobile station. See Annex B for detailed location data. Note, because of the above configuration, the true time offset between the base stations' signals observed at the mobile station's location should be zero.
- If the mobile station is capable of location computation based on AFLT measurements (Bit 3 or Bit 8 or both is set to '1' in the *Provide MS Information* message sent by the mobile station), and the returned location is evaluated, then the alternative base station synchronization method described in 6.4.2 shall not be used. Instead, the stricter requirement of maintaining less than 30 ns timing offset between the base stations shall be met (see 6.4.2).
- The limit values for each measurement parameter represent an interpretation of the returned values with the units stated and are not the actual returned binary values.

1 **4.2 AFLT Performance Specifications**

2 The measurement performance specifications described in this section set a minimum
 3 acceptable level of accuracy for the AFLT measurements returned by the mobile station
 4 under various test conditions.

5 4.2.1 AFLT Accuracy Test

6 4.2.1.1 Definition

7 The purpose of this test is to determine the mobile station’s capability to obtain precise
 8 pilot phase measurements under favorable signal level and HDOP conditions. The base
 9 station simulators shall provide high SNR signals representing three base stations. A
 10 sequence of independent measurements is carried out. In each measurement, the mobile
 11 station shall return a *Provide Location Response* message if the mobile station is capable of
 12 location computation; or it shall return one or more *Provide Pilot Phase Measurement*
 13 messages if it is not capable of location computation. The test may be stopped when the
 14 required confidence levels are met for all tested parameters.

15 4.2.1.2 Method of Measurement

- 16 1. Connect three base station simulators and an AWGN generator to the mobile station as
 17 shown in Figure 6.12.1-2.
- 18 2. For each band class that the mobile station supports, configure the mobile station to
 19 operate in that band class and perform steps 3 through 12.
- 20 3. Configure the serving base station according to the standard test parameters listed in
 21 6.12.2.
- 22 4. Set the base station simulator and AWGN generator output levels according to Table
 23 4.2.1.2-1.

24
 25 **Table 4.2.1.2-1 Signal Levels for the AFLT Accuracy Test**

Parameter	Unit	Base Station 1	Base Station 2	Base Station 3
\bar{I}_{Or}/I_{Oc}	dB	3	0	0
I_{Oc}	dBm/1.23 MHz	-58		
$\frac{\text{Pilot } E_c}{I_0}$	dB	-11	-14	-14

26 Note: The Pilot E_c/I_0 value is calculated from the parameters in the table. It is
 27 not a directly settable parameter.

- 28
- 29 5. Measure and record the time offset between the base stations (see 6.4.2).
- 30 6. Repeat Steps 7 through 12.

- 1 7. Power up the mobile station.
- 2 8. Reset the position location related parameters stored by the mobile station.
- 3 9. Initiate a mobile terminated voice call.
- 4 10. Initiate a Test Mode 4 session.
- 5 11. Record the values returned by the mobile station.
- 6 12. Power down the mobile station.

7 4.2.1.3 Minimum Specification

8 The parameters returned by the mobile station shall satisfy the requirements listed in Table
 9 4.2.1.3-1; the confidence level for all σ_1 , σ_2 type tests shall be 90% (see also 1.6).

10
 11

Table 4.2.1.3-1 Minimum Specifications for the AFLT Accuracy Test

Mobile Station Response	Parameter Field	Limit Parameter	Limit Value
<i>Provide MS Information</i>	N/A	T_1	750 ms
<i>Provide Pilot Phase Measurement</i>	PILOT_PN_PHASE	N	3
		T_2	8 s

		T_2	8 s
		LATLONG ₁	45 m
		LATLONG ₂	135 m

12

1 4.2.2 AFLT Sensitivity Test

2 4.2.2.1 Definition

3 The purpose of this test is to determine the mobile station's capability to obtain pilot phase
 4 measurements under weak signal level conditions. The base station simulators shall
 5 provide a high SNR serving sector signal and two low SNR neighbor pilot signals. A
 6 sequence of independent measurements is carried out. In each measurement, the mobile
 7 station shall return a *Provide Location Response* message if the mobile station is capable of
 8 location computation; or it shall return one or more *Provide Pilot Phase Measurement*
 9 messages if it is not capable of location computation. The test may be stopped when the
 10 required confidence levels are met for all tested parameters.

11 4.2.2.2 Method of Measurement

- 12 1. Connect three base station simulators and an AWGN generator to the mobile station as
 13 shown in Figure 6.12.1-2.
- 14 2. For each band class that the mobile station supports, configure the mobile station to
 15 operate in that band class and perform steps 3 through 12.
- 16 3. Configure the base station according to the standard test parameters listed in 6.12.2.
- 17 4. Set the base station simulator and AWGN generator output levels according to Table
 18 4.2.2.2-1.

19
 20

Table 4.2.2.2-1 Signal Levels for the AFLT Sensitivity Test

Parameter	Unit	Base Station 1	Base Station 2	Base Station 3
\bar{I}_{Or}/I_{Oc}	dB	0	-15.9	-15.9
I_{Oc}	dBm/1.23 MHz	-55		
$\frac{\text{Pilot } E_c}{I_0}$	dB	-10.1	-26	-26

21 Note: The Pilot E_c/I_0 value is calculated from the parameters in the table. It is
 22 not a directly settable parameter.

23

- 24 5. Measure and record the time offset between the base stations (see 6.4.2).
- 25 6. Repeat Steps 7 through 12.
- 26 7. Power up the mobile station.
- 27 8. Reset the position location related parameters stored by the mobile station.
- 28 9. Initiate a mobile terminated voice call.
- 29 10. Initiate a Test Mode 4 session.

- 1 11. Record the values returned by the mobile station.
 2 12. Power down the mobile station.

3 4.2.2.3 Minimum Specification

4 The parameters returned by the mobile station shall satisfy the requirements listed in Table
 5 4.2.2.3-1; the confidence level for all σ_1 , σ_2 type tests shall be 90% (see also 1.6).

6
 7

Table 4.2.2.3-1 Minimum Specifications for the AFLT Sensitivity Test

Mobile Station Response	Parameter Field	Limit Parameter	Limit Value
<i>Provide MS Information</i>	N/A	T_1	750 ms
<i>Provide Pilot Phase Measurement</i>	PILOT_PN_PHASE	N	3
		T_2	8 s
		PNPHASE ₁	5/16 PN chips
		PNPHASE ₂	9/16 PN chips

	R_2	4	
<i>Provide Location Response</i>	LAT LONG	N	1
		T_2	8 s
		LATLONG ₁	90 m
		LATLONG ₂	180 m

8

9 **4.3 AFLT Protocol Tests**

10 The protocol tests presented in this section shall be performed if the tests listed in 2.2 are
 11 not performed.

1 4.3.1 AFLT Position Location Session on the Paging Channel Test

2 4.3.1.1 Definition

3 The purpose of this test is to determine the mobile station’s capability to operate in a mode
4 where the base station initiates a position location session on the Paging Channel.

5 4.3.1.2 Method of Measurement

- 6 1. Connect three base station simulators to the mobile station as shown in Figure
- 7 6.12.1-2.
- 8 2. Configure the mobile station to operate in a band class it supports.
- 9 3. Configure the base station according to the standard test parameters listed in 6.12.2.
- 10 4. Set the base station simulator output levels according to Table 4.3.1.2-1.

11
12 **Table 4.3.1.2-1 Signal Levels for the AFLT Protocol Tests**

Parameter	Unit	Channel 1	Channel 2	Channel 3
\hat{I}_{or}	dBm/1.23 MHz	-55	-58	-58
$\frac{\text{Pilot } E_C}{I_0}$	dB	-10	-13	-13

13 Note: The Pilot E_C/I_0 value is calculated from the parameters in the table. It is
14 not a directly settable parameter.

- 15
- 16 5. Power up the mobile station.
- 17 6. Reset the position location related parameters stored by the mobile station.
- 18 7. Initiate a mobile terminated voice call.
- 19 8. Initiate a Test Mode 3 session.
- 20 9. Record the values returned by the mobile station.
- 21 10. Power down the mobile station.

22 4.3.1.3 Minimum Specification

23 The mobile station shall respond to base station requests received on the Paging Channel
24 and it shall complete the position location session by returning a *Provide Location Response*
25 message if the mobile station is capable of location computation; or it shall return one or
26 more *Provide Pilot Phase Measurement* messages if it is not capable of location computation.
27 The parameters returned by the mobile station shall satisfy the requirements listed in Table
28 4.3.1.3-1 (see also 1.6).

29

1 **Table 4.3.1.3-1 Minimum Specifications for the AFLT Position Location Session on**
 2 **the Paging Channel Test**

Mobile Station Response	Parameter Field	Limit Parameter	Limit Value
<i>Provide Pilot Phase Measurement</i>	PILOT_PN_PHASE	<i>N</i>	2
		<i>T₂</i>	16 s
<i>Provide Location Response</i>	LAT LONG	<i>N</i>	1
		<i>T₂</i>	16 s

3

4 4.3.2 Mobile Station Originated AFLT Position Location Session Test

5 These tests shall only be applied to mobile stations that support mobile station originated
 6 position location sessions.

7 4.3.2.1 Access Channel Test

8 4.3.2.1.1 Definition

9 This test shall be only applied to mobile stations that support position location session
 10 origination on the Access Channel. The purpose of this test is to determine the mobile
 11 station's capability to operate in a mode where the position location session is originated by
 12 the mobile station.

13 4.3.2.1.2 Method of Measurement

- 14 1. Connect three base station simulators to the mobile station as shown in Figure
 15 6.12.1-2.
- 16 2. Configure the mobile station to operate in a band class it supports.
- 17 3. Configure the serving base station according to the standard test parameters listed in
 18 6.12.2.
- 19 4. Set the base station simulator output levels according to Table 4.3.1.2-1.
- 20 5. Power up the mobile station.
- 21 6. Reset the position location related parameters stored by the mobile station.
- 22 7. Initiate a Test Mode 1 session.
- 23 8. Record the values returned by the mobile station or the computed location stored in the
 24 mobile station.
- 25 9. Power down the mobile station.

1 4.3.2.1.3 Minimum Specification

2 The mobile station shall complete the position location session by returning one or more
3 *Provide Pilot Phase Measurement* messages if it is not capable of location computation or by
4 computing its own location otherwise.

5 Note, if the mobile station is capable of location computation, it may return neither pilot
6 phase measurement values nor the calculated position during this test. In this case the
7 calculated position shall be retrieved from the mobile station by other means (for example,
8 through the data port).

9 The parameters returned or computed by the mobile station shall satisfy the requirements
10 listed in Table 4.3.2.1.3-1 (see also 1.6).

11 Note, time limit T_2 applies to the measurement time period that starts when the position
12 location session is invoked at the mobile station.

13

14 **Table 4.3.2.1.3-1 Minimum Specifications for the Mobile Station Originated AFLT**
15 **Position Location Session Tests**

Mobile Station Response	Parameter Field	Limit Parameter	Limit Value
<i>Provide Pilot Phase Measurement</i>	PILOT_PN_PHASE	N	2
		T_2	16 s
Computed Mobile Station Location	N/A	N	1
		T_2	16 s

16

17 4.3.2.2 Dedicated Channel Test

18 4.3.2.2.1 Definition

19 This test shall only be applied to mobile stations that support position location session
20 origination on a dedicated channel. The purpose of this test is to determine the mobile
21 station's capability to operate in a mode where the position location session is originated by
22 the mobile station.

23 4.3.2.2.2 Method of Measurement

- 24 1. Connect three base station simulators to the mobile station as shown in Figure
25 6.12.1-2.
- 26 2. Configure the mobile station to operate in a band class it supports.
- 27 3. Configure the serving base station according to the standard test parameters listed in
28 6.12.2.
- 29 4. Set the base station simulator output levels according to Table 4.3.1.2-1.

- 1 5. Power up the mobile station.
- 2 6. Reset the position location related parameters stored by the mobile station.
- 3 7. Set up a mobile station originated voice call.
- 4 8. Initiate a Test Mode 2 session.
- 5 9. Record the values returned by the mobile station or the computed location stored in the
- 6 mobile station.
- 7 10. Power down the mobile station.

8 4.3.2.2.3 Minimum Specification

9 The mobile station shall complete the position location session by returning one or more
10 *Provide Pilot Phase Measurement* messages if it is not capable of location computation or by
11 computing its own location otherwise.

12 Note, if the mobile station is capable of location computation, it may return neither pilot
13 phase measurement values nor the calculated position during this test. In this case the
14 calculated position shall be retrieved from the mobile station by other means (for example,
15 through the data port).

16 The parameters returned or computed by the mobile station shall satisfy the requirements
17 listed in Table 4.3.2.1.3-1 (see also 1.6).

18 Note, time limit T_2 applies to the measurement time period that starts at invoking the
19 position location session at the mobile station.

20

21

- 1 This page intentionally left blank.

1 5 HYBRID MINIMUM SPECIFICATIONS

2 The tests described in this section shall be performed for hybrid capable mobile stations.
3 Hybrid capable mobile stations shall also meet all requirements listed in 2 and 3.

4 5.1 General Comments on Hybrid Tests

5 The following comments apply to all hybrid test cases:

- 6 ▪ Hybrid tests are described as using base stations or base station simulators, but it is
7 understood that equivalent pilot generators for the non-serving base stations may be
8 used.
- 9 ▪ In the hybrid tests, either three base stations (base station 1, 2 and 3) or two base
10 stations are used. In the case of two base stations being used, the base station
11 configuration is the same as in the three base station case but base station 3 is
12 omitted.
- 13 ▪ No handoff scenario tests are included; the serving base station is always base station
14 1.
- 15 ▪ For all hybrid tests, base station 1 pilot PN offset is P_0 , base station 2 pilot PN offset
16 is P_1 and base station 3 PN offset is P_2 , where P_0 , P_1 and P_2 are arbitrary values
17 satisfying the requirements listed in 6.12.2. Furthermore, P_0 corresponds to
18 PILOT_PN in the *Sync Channel Message* and to REF_PN in the PDE simulator GPS
19 assistance messages, while P_1 and P_2 correspond to the appropriate values in both
20 the *General Neighbor List Message* (see Table 6.12.2-4) and the PDE simulator *Provide*
21 *Base Station Almanac* message.
- 22 ▪ For all hybrid tests, the simulated locations (not the actual physical locations) of the
23 mobile station and the base stations are as follows: The three base stations form an
24 equilateral triangle with the mobile station being at the geometric center of the
25 triangle. Each base station is at a distance of 5 km from every other base station;
26 thus, the mobile station is at a distance of $5/\sqrt{3}$ km from each base station. Base
27 station 1 is due north from the mobile station, and base station 2 is southeast from
28 the mobile station. See Annex B for detailed location data. Note, because of the
29 above configuration, the true time offset between the base stations' signals observed
30 at the mobile station's location should be zero.
- 31 ▪ The inconsistency between the assumed mobile station to base station distance as
32 specified above and the physical base station to mobile station signal propagation
33 delay is compensated by setting the TIME_CRRECTION_REF and TIME_CORRECTION
34 fields in the *Provide Base Station Almanac* message to the appropriate values.
- 35 ▪ In this section where the mobile station is capable of location computation, the
36 alternative base station to base station and base station to GPS simulator
37 synchronization method described in 6.4.2 and 6.6 shall not be used. Instead, the
38 stricter requirement of maintaining less than 30 ns timing offset shall be met (see
39 6.4.2 and 6.6).

- 1 ▪ The limit values for each measurement parameter represent an interpretation of the
2 returned values with the units stated and are not the actual returned binary values.

3 **5.2 Hybrid Performance Specifications**

4 The measurement performance specifications described in this section set a minimum
5 acceptable level of accuracy for the hybrid measurements returned by the mobile station
6 under various test conditions.

7 5.2.1 One Base Station + Three Satellites Hybrid Test

8 5.2.1.1 Definition

9 This test shall only be applied to mobile stations that are capable of location computation.
10 The purpose of this test is to determine the mobile station's capability to compute location
11 based on only three visible satellites. The GPS simulator shall provide high SNR signals
12 representing three satellites with HDOP less than 3.8. Note that the GPS assistance
13 provided by the serving base station is not limited to three satellites during this test. A
14 sequence of independent measurements is carried out. In each measurement, the mobile
15 station shall return a *Provide Location Response* message. The test may be stopped when
16 the required confidence levels are met for all tested parameters.

17 5.2.1.2 Method of Measurement

- 18 1. Connect a base station simulator and a GPS simulator to the mobile station as shown
19 in Figure 6.12.1-3.
20 2. Configure the mobile station to operate in a band class it supports.
21 3. Configure the base station according to the standard test parameters listed in 6.12.2.
22 4. Configure the GPS simulator according to the standard test parameters listed in Annex
23 B.
24 5. Set the GPS simulator output levels according to Table 5.2.1.2-1. Satellites not listed in
25 Table 5.2.1.2-1 shall not be simulated.

26

27 **Table 5.2.1.2-1 Satellite Signal Levels for the One Base Station + Three Satellites**
28 **Hybrid Test**

Satellite PRN Number	Signal Level (dBm)	C/N ₀ (dB-Hz)
14, 17, 31	-144	30

29

- 30 6. Repeat Steps 7 through 12.
31 7. Power up the mobile station.

- 1 8. Reset previous measurements, computed positions, values calculated during previous
- 2 fixes and GPS system time.
- 3 9. Initiate a mobile terminated voice call.
- 4 10. Initiate a Test Mode 4 session.
- 5 11. Record the values returned by the mobile station.
- 6 12. Power down the mobile station.

7 5.2.1.3 Minimum Specification

8 The parameters returned by the mobile station shall satisfy the requirements listed in Table
 9 5.2.1.3-1; the confidence level for the σ_1 , σ_2 type tests shall be 90% (see also 1.6).

10
 11 **Table 5.2.1.3-1 Minimum Specifications for the One Base Station + Three Satellites**
 12 **Hybrid Test**

Mobile Station Response	Parameter Field	Limit Parameter	Limit Value
<i>Provide MS Information</i>	N/A	T_1	750 ms

		LATLONG ₂	175 m

13

14 5.2.2 Two Base Stations + One Satellite Hybrid Test

15 5.2.2.1 Definition

16 This test shall only be applied to mobile stations that are capable of location computation.
 17 The purpose of this test is to determine the mobile station's capability to obtain a position
 18 solution by using altitude aiding and observing signals from two base stations and one
 19 satellite. The base station simulators shall provide high SNR signals representing two base
 20 stations. The GPS simulator shall provide high SNR signal representing one satellite, which
 21 is located approximately at elevation equal to 45° and azimuth equal to -120°. Note that
 22 the GPS assistance provided by the serving base station is not limited to one satellite
 23 during this test. A sequence of independent measurements is carried out. In each
 24 measurement, the mobile station shall return a *Provide Location Response* message. The
 25 test may be stopped when the required confidence levels are met for all tested parameters.

1 5.2.2.2 Method of Measurement

- 2 1. Connect two base station simulators, a GPS simulator and an AWGN generator to the
 3 mobile station as shown in Figure 6.12.1-3.
 4 2. Configure the mobile station to operate in a band class it supports.
 5 3. Configure the serving base station according to the standard test parameters listed in
 6 6.12.2.
 7 4. Configure the GPS simulator according to the standard test parameters listed in Annex
 8 B.
 9 5. Set the base station simulator and AWGN generator output levels according to Table
 10 5.2.2.2-1.

11
 12 **Table 5.2.2.2-1 Base Station Signal Levels for the Two Base Stations + One Satellite**
 13 **Hybrid Test**

Parameter	Unit	Base Station 1	Base Station 2
\bar{I}_{or}/I_{oc}	dB	5	2
I_{oc}	dBm/1.23 MHz	-55	
$\frac{\text{Pilot } E_c}{I_0}$	dB	-9.6	-12.6

14 Note: The Pilot E_c/I_0 value is calculated from the parameters
 15 in the table. It is not a directly settable parameter.

- 16
 17 6. Set the GPS simulator output level according to Table 5.2.2.2-2. Satellites not listed in
 18 Table 5.2.2.2-2 shall not be simulated.

19

 21 **Test**

Satellite PRN Number	Signal Level (dBm)	C/N ₀ (dB-Hz)
3	-144	30

- 22
 23 7. Repeat Steps 8 through 13.
 24 8. Power up the mobile station.
 25 9. Reset previous measurements, computed positions, values calculated during previous
 26 fixes and GPS system time.

- 1 10. Initiate a mobile terminated voice call.
 2 11. Initiate a Test Mode 4 session.
 3 12. Record the values returned by the mobile station.
 4 13. Power down the mobile station.

5 5.2.2.3 Minimum Specification

6 The parameters returned by the mobile station shall satisfy the requirements listed in Table
 7 5.2.2.3-1; the confidence level for the σ_1 , σ_2 type tests shall be 90% (see also 1.6).

8

1 **6 STANDARD TEST CONDITIONS**

2 **6.1 Standard Equipment**

3 6.1.1 Basic Equipment

4 The equipment shall be assembled, and any necessary adjustments shall be made in
5 accordance with the manufacturer's instructions for the mode of operation required. When
6 alternative modes are available, the equipment shall be assembled and adjusted in
7 accordance with the relevant instructions. A complete series of measurements shall be
8 made for each mode of operation.

9 6.1.2 Associated Equipment

10 The mobile station equipment may include associated equipment during tests, provided
11 that the associated equipment is normally used in the operation of the equipment under
12 test. For mobile station equipment, this may include power supplies, handsets, cradles,
13 charging stands, control cables and battery cables.

14 **6.2 Standard Environmental Test Conditions**

15 Measurements under standard atmospheric conditions shall be carried out under any
16 combination of the following conditions:

- 17 ▪ Temperature: +15°C to +35°C
- 18 ▪ Relative humidity: 10% to 75%
- 19 ▪ Air pressure: 86,000 Pa to 106,000 Pa (860 mbar to 1060 mbar)

20 If desired, the results of the measurements can be corrected by calculation to the standard
21 reference temperature of 25°C and by the standard reference air pressure of 101,300 Pa
22 (1013 mbar).

23 The values of noise spectral density presented in this Specification are valid for +17°C, 290
24 K. If testing is done at any other temperature, the value of the noise spectral density, N_0 ,
25 should be scaled according to the following formula: $N_0 = k \times T$ where k is the Boltzman
26 constant, $k = 1.380658 \times 10^{-23}$ J/K, and T is the room temperature expressed in units of
27 Kelvin.

28 **6.3 Standard Conditions for the Primary Power Supply**

29 6.3.1 General Requirements

30 The standard test voltages shall be those specified by the manufacturer, or an equivalent
31 type that duplicates the voltage, impedance, and ampere-hours (if relevant for the
32 measurement) of the recommended supply.

33 6.3.2 Standard DC Test Voltage from Accumulator Batteries

34 The standard (or nominal) DC test voltage specified by the manufacturer shall be equal to
35 the standard test voltage of the type of accumulator to be used, multiplied by the number of

1 cells, minus an average DC power cable loss value that the manufacturer determines as
2 being typical (or applicable) for a given installation. Since accumulator batteries may, or
3 may not, be under charge, or may be in a state of discharge when the equipment is being
4 operated, the manufacturer shall also test the equipment at anticipated voltage extremes
5 above and below the standard voltage. The test voltages shall not deviate from the stated
6 values by more than $\pm 2\%$ during a series of measurements carried out as part of a single
7 test on the same equipment.

8 6.3.3 Standard AC Voltage and Frequency

9 For equipment that operates from the AC mains, the standard AC test voltage shall be
10 equal to the nominal voltage specified by the manufacturer. If the equipment is provided
11 with different input taps, the one designated "nominal" shall be used. The standard test
12 frequency and the test voltage shall not deviate from their nominal values by more than
13 $\pm 2\%$.

14 The equipment shall operate without degradation, with input voltage variations of up to
15 $\pm 10\%$, and shall maintain its specified transmitter frequency stability for input voltage
16 variations of up to $\pm 15\%$. The frequency range over which the equipment is to operate shall
17 be specified by the manufacturer.

18 **6.4 Standard CDMA Test Equipment**

19 6.4.1 Base Station Simulator Equipment

20 6.4.1.1 Transmitter Equipment

21 The base station transmitter shall be capable of generating the following channels at the
22 specified output power, relative to the total power:

- 23 ▪ Pilot Channel: -5 dB to -10 dB.
- 24 ▪ Sync Channel: -7 dB to -20 dB.
- 25 ▪ Paging Channel: -7 dB to -20 dB.
- 26 ▪ Traffic Channel: -7 dB to -20 dB or off for full rate power output. Lower rates will
27 reduce the Traffic Channel power so as to maintain a constant energy per bit.
- 28 ▪ Power Control Subchannel: This is always transmitted at the same power as the full
29 rate speech bits.
- 30 ▪ OCNS: 0 dB to -6 dB or off. The OCNS may, as an option, be composed of Paging,
31 Sync or Traffic Channels, all operating on different Walsh channels than the
32 channel(s) being used for test.

33 In addition, the base station transmitter shall meet the following requirements:

- 34 ▪ Frequency range: base station frequencies as specified in [2]
- 35 ▪ Frequency accuracy: ± 0.2 ppm
- 36 ▪ Frequency resolution: 10 Hz

- 1 ▪ Code phase offset resolution: 100 ns
- 2 ▪ Code phase offset accuracy (referenced to the even second output): ± 20 ns
- 3 ▪ Output range: -40 dBm/1.23 MHz to -110 dBm/1.23 MHz
- 4 ▪ Amplitude resolution: 1 dB for all channels
- 5 ▪ Output accuracy (relative levels between any two channels): ± 1 dB
- 6 ▪ Absolute output accuracy: ± 2.0 dB
- 7 ▪ Minimum waveform quality factor (ρ): greater than 0.966 (excess power is less than
- 8 0.15 dB)
- 9 ▪ Source VSWR: 2.0:1

10 Forward Link Power Control:

- 11 ▪ When Forward Link Power Control is used, the latency shall be less than 2 power
- 12 control groups between the end of the power control group with an active power
- 13 control bit and the corresponding change in power in the base station simulator.
- 14 ▪ When Forward Link Power Control is used, the OCNS shall be adjusted to maintain
- 15 constant base station power. The OCNS adjustments should be made in the same
- 16 power control group as the response to Power Control Bits and shall occur no more
- 17 than one power control group later than the response to Power Control Bits.

18 6.4.1.2 Receiver Equipment

19 Input Range -50 dBm to +40 dBm. External attenuators or amplifiers or both may be used
20 to meet these power requirements, and may be considered as part of the equipment.

21 6.4.1.3 Protocol Support

22 The base station shall be capable of supplying the protocols required by this document.

23 6.4.1.4 Timing Signals

24 The base station shall provide the following system timing signals, referenced to the base
25 station antenna port for use as triggers by other measurement equipment:

- 26 ▪ 10 MHz frequency reference
- 27 ▪ Even second time mark

28 The base station shall provide signals synchronized to the following event:

- 29 ▪ Start of reference clock at preset system time
- 30 ▪ Start of power control bit sequence

31 6.4.1.5 Base Station *Data Burst Message* Transport Capability

32 The serving base station shall be capable of transporting *Data Burst Messages* in both
33 directions between an auxiliary test equipment connected to it (for example, the PDE
34 simulator described in 6.10) and the mobile station.

1 The serving base station shall meet the following requirements:

- 2 ▪ The serving base station shall provide a transparent connection between the auxiliary
3 test equipment and the mobile station.
- 4 ▪ The serving base station shall be capable of sending *Data Burst Messages* on both the
5 paging channel and the forward link traffic channel and receiving *Data Burst*
6 *Messages* on both the access channel and the reverse link traffic channel.
- 7 ▪ The latency between the end of the reception of a *Data Burst Message* and the
8 transmission of the end of the same *Data Burst Message* by the serving base station
9 shall be less than 1 s.

10 6.4.2 Synchronization of Base Stations

11 If more than one base station is used in a test and the base stations don't share an internal
12 timing source, then synchronization of the base stations must be achieved by external
13 means.

14 The synchronization may be achieved by using two separate connections:

- 15 1. For frequency synchronization, the serving base station's 10 MHz reference signal
16 should be used.
- 17 2. For system time synchronization, the serving base station's even second timing signal
18 should be used.

19 The synchronization between the base stations shall meet the following minimum
20 requirements:

- 21 ▪ Frequency offset between the base station carriers shall be less than ± 0.02 ppm.
- 22 ▪ Phase offset between the base station carriers shall be constant within ± 0.2 radians
23 throughout the test.
- 24 ▪ The timing offset between the base stations (i.e. system time modified by the code
25 phase offset adjustments), referenced to the mobile station's antenna input, shall be
26 less than ± 30 ns.

27 If the requirement regarding the timing offset between the base stations is not met, the use
28 the following method is permissible, unless specified otherwise in a test:

- 29 1. Connect a clock/counter to the two base stations' even second pulse output, so that the
30 clock measures the time difference between the active edges of the even second pulses
31 outputted by the two base stations. The clock/counter may use an internal time
32 reference or, optionally, derive its internal time reference from one of the base stations'
33 10 MHz signal.
- 34 2. At the beginning of the measurement, record the measured time difference.
- 35 3. Before evaluation, correct the pilot phase measurements with the measured offset.

36 When using the method described above, the achieved synchronization shall meet the
37 following minimum requirements:

- 1 ▪ The timing offset between the base stations' even second pulse output shall be less
2 than $\pm 1 \mu\text{s}$.
- 3 ▪ The timing offset between the base stations' even second pulse output shall be
4 measured with accuracy better than $\pm 10 \text{ ns}$.

5 6.4.3 CDMA Pilot Generator Equipment

6 When a particular test requires the use of more than one base station, the non-serving base
7 stations may be simulated by using CDMA pilot generators instead of base station
8 simulators. In this case, if the AWGN generator is also connected (i.e. for all tests other
9 than protocol tests), then the AWGN generator's output signal level is adjusted so that the
10 specified Pilot E_C/I_0 values are maintained for all pilots.

11 6.4.3.1 Transmit Equipment

12 The requirements for the CDMA pilot generator transmit equipment shall be the same as
13 the requirements relevant to the pilot signal in 6.4.1.1.

14 6.4.3.2 Timing Signals

15 The CDMA pilot generator shall accept the following system timing signals, referenced to
16 the CDMA pilot generator antenna port:

- 17 ▪ 10 MHz frequency reference
- 18 ▪ Even-second time mark

19 The CDMA pilot generator shall provide the following timing signal, referenced to the CDMA
20 station antenna port for use as triggers by other measurement equipment:

- 21 ▪ Even second time mark

22 6.4.3.3 Synchronization of a CDMA Pilot Generator

23 The requirements for the CDMA pilot generator transmit equipment shall be the same as
24 the requirements relevant to the base station simulator in 6.4.2.

25 **6.5 GPS Simulator Equipment**

26 The GPS simulator shall be capable of all of the following:

- 27 ▪ Generate eight independent C/A signals on the L1 frequency.
- 28 ▪ Set accurate satellite positions and timing, based on Ephemeris data input, where all
29 Ephemeris parameter fields are populated.
- 30 ▪ Set the signal phase dynamically, based on the satellite and user positions, with
31 added offset derived from ionospheric, tropospheric and group delay models.
- 32 ▪ Simultaneously generate signals representing specified code phase and power level
33 offsets for a given satellite.
- 34 ▪ Set the user position to be stationary or in motion along a circular trajectory.

- 1 ▪ Modulate the satellite signal with navigation bits with a specified bit stream in a
- 2 manner that is consistent with the simulated GPS system time.
- 3 ▪ Start the simulation at a preset GPS system time, triggered by an external signal.

4 The GPS simulator shall meet the following minimum requirements:

- 5 ▪ Frequency (L1): 1575.42 MHz
- 6 ▪ Frequency accuracy: ± 0.2 ppm
- 7 ▪ Code phase accuracy (referenced to the 1 PPS output): ± 20 ns
- 8 ▪ Doppler resolution: 0.5 Hz
- 9 ▪ Doppler accuracy: ± 5 Hz
- 10 ▪ Output range referenced to the mobile station antenna input: -125 dBm to -149 dBm.
- 11 Note that it may be necessary to utilize attenuators or other RF elements to achieve
- 12 the required GPS signal levels at the mobile station antenna input. In all cases, the
- 13 GPS L1 band noise power spectral density at the mobile station antenna input will be
- 14 -174 dBm/Hz, which is equivalent to room temperature thermal noise.
- 15 ▪ Amplitude resolution: 1 dB for all channels
- 16 ▪ Output accuracy (relative levels between any two channels): ± 1.0 dB
- 17 ▪ Absolute output accuracy: ± 2.0 dB
- 18 ▪ Source VSWR: 2.0:1

19 The GPS simulator shall accept the following system timing signals, referenced to the GPS

20 antenna port:

- 21 ▪ 10 MHz frequency reference
- 22 ▪ Even-second time mark

23 The GPS simulator shall provide the following timing signal, referenced to the CDMA station

24 antenna port for use as triggers by other measurement equipment:

- 25 ▪ 1 PPS signal

26 **6.6 GNSS Simulator Equipment**

27 The GNSS simulator shall be capable of all of the following:

- 28 ▪ Generate six or seven¹⁷ independent signals on the individual frequency for each
- 29 supported GNSS.
- 30 ▪ Set accurate satellite positions and timing, based on Ephemeris data input, where all
- 31 Ephemeris parameter fields are populated.
- 32 ▪ Set the signal phase dynamically, based on the satellite and user positions, with
- 33 added offset derived from ionospheric, tropospheric and group delay models.

¹⁷ Seven signals including SBAS may be generated for GNSS Accuracy test

- 1 ▪ Simultaneously generate signals representing specified code phase and power level
- 2 offsets for a given satellite.
- 3 ▪ Set the user position to be stationary or in motion along a circular trajectory.
- 4 ▪ Modulate the satellite signal with navigation bits with a specified bit stream in a
- 5 manner that is consistent with the simulated GNSS system time.
- 6 ▪ Start the simulation at a preset GNSS system time, triggered by an external signal.

7 The GNSS simulator shall meet the following minimum requirements:

- 8 ▪ Frequency: Frequencies per the supported GNSS are listed in Table 6.6-1.

9 **Table 6.6-1 Frequencies for Various GNSS Signal Types**

	Galileo		GPS/Modernized GPS		GLONASS*		QZSS		SBAS	
Frequency (MHz)	E1	1575.42	L1 C/A	1575.42	G1	$1602+K*\Delta f_1$	L1 C/A	1575.42	L1	1575.42
	E6	1278.75	L1C	1575.42	G2	$1246+K*\Delta f_2$	L1C	1575.42		
	E5a	1176.45	L2C	1227.6			L2C	1227.6		
	E5b	1207.14	L5	1176.45			L5	1176.45		

10 * $\Delta f_1=562.5\text{kHz}$, $\Delta f_2=437.5\text{kHz}$ and $K=-7\sim 13$

- 11 ▪ Frequency accuracy: ± 0.2 ppm
- 12 ▪ Code phase accuracy (referenced to the 1 PPS output): ± 20 ns
- 13 ▪ Doppler resolution: 0.5 Hz
- 14 ▪ Doppler accuracy: ± 5 Hz
- 15 ▪ Output range per the supported GNSS referenced to the mobile station antenna input
- 16 is as specified in Table 6.6-2:

1

Table 6.6-2 Output Ranges for Various GNSS Signal Types

	Galileo		GPS/Modernized GPS		GLONASS		QZSS		SBAS	
	Signal	Power Range (dBm)	Signal	Power Range (dBm)	Signal	Power Range (dBm)	Signal	Power Range (dBm)	Signal	Power Range (dBm)
Output range (dBm)	E1	-127~-149	L1 C/A	-128.5~-149	G1	-131~-149	L1 C/A	-128.5	L1	-131
	E6	-125~-147	L1C	-127~-147.5	G2	-137~-155	L1C	-127		
	E5	-125~-147	L2C	-130~-150.5			L2C	-130		
			L5	-124.9~-145.4			L5	-124.9		

2 Note that it may be necessary to utilize attenuators or other RF elements to achieve the
 3 required GNSS signal levels at the mobile station antenna input. In all cases, the GNSS
 4 noise power spectral density at the mobile station antenna input will be -174 dBm/Hz,
 5 which is equivalent to room temperature thermal noise.

6

- 7 ▪ Amplitude resolution: 1 dB for all channels
- 8 ▪ Output accuracy (relative levels between any two channels): ±1.0 dB
- 9 ▪ Absolute output accuracy: ±2.0 dB
- 10 ▪ Source VSWR: 2.0:1
- 11 ▪ GNSS-GNSS time offset accuracy: ±3ns

12 The GNSS simulator shall accept the following system timing signals, referenced to the
 13 GNSS antenna port:

- 14 ▪ 10 MHz frequency reference
- 15 ▪ Even-second time mark

16 The GNSS simulator should provide the following timing signal, referenced to the CDMA
 17 station antenna port for use as triggers by other measurement equipment:

- 18 ▪ 1 PPS signal

19 **6.7 Synchronization of the Serving Base Station and the GPS Simulator**

20 Time synchronization between the serving base station and the GPS simulator is critical in
 21 some cases, since many MS implementations assume acquiring GPS system time from the
 22 CDMA network.

23 The synchronization may be achieved by using two separate connections:

- 24 1. For frequency synchronization, the serving base station’s 10 MHz reference signal
 25 should be used. Optionally, the direction of the signal may be reversed so that the
 26 clock with higher precision is configured as the source.

- 1 2. For system time synchronization, the serving base station's even second signal should
2 be used. Both the base station and the GPS simulator will be preset to start at the same
3 predetermined reference time value at the occurrence of the first even second pulse.
4 Optionally, the direction of the even second (or 1 PPS) signal may be reversed, so that
5 the GPS simulator's timing signal serves as the source.

6 The synchronization between the base station and the GPS simulator shall meet the
7 following minimum requirements:

- 8 ▪ Frequency offset between the base station and the GPS simulator carriers (after
9 frequency division to match the lower of the two frequencies) shall be less than ± 0.02
10 ppm.
11 ▪ Phase offset between the base station and the GPS simulator carriers (after frequency
12 division to match the lower of the two frequencies) shall be constant within ± 0.2
13 radians throughout the test.
14 ▪ The timing offset between the serving base station and the GPS simulator (i.e. the
15 offset between CDMA and GPS system time), referenced to the mobile station's
16 antenna input, shall be less than ± 30 ns.

17 If the requirement regarding the timing offset is not met, the use the following method is
18 permissible, unless specified otherwise in a test:

- 19 1. Connect a clock/counter to the serving base station's even second pulse output and the
20 GPS simulator's 1 PPS output, so that the clock measures the time difference between
21 the active edges of the even second and the 1 PPS pulses. The clock/counter can use
22 an internal time reference or, optionally, derive the internal time from the serving base
23 station's or the GPS simulator's 10 MHz signal.
24 2. At the beginning of the measurement, record the measured time difference.
25 3. Before evaluation, correct the pseudorange measurements or the clock bias returned by
26 the mobile station with the measured offsets.

27 When using the method described above, the achieved synchronization shall meet the
28 following minimum requirements:

- 29 ▪ The timing offset between the even second pulse and the 1 PPS pulse shall be less
30 than ± 10 μ s.
31 ▪ The timing offset between the even second signal and the 1 PPS signal shall be
32 measured with accuracy better than ± 10 ns.

33 **6.8 Synchronization of the Serving Base Station and the GNSS Simulator**

34 The synchronization between the serving base station and the GNSS simulator may be
35 achieved by using two separate connections:

- 36 1. For frequency synchronization, the serving base station's 10 MHz reference signal
37 should be used. Optionally, the direction of the signal may be reversed so that the
38 clock with higher precision is configured as the source.

- 1 2. For system time synchronization, the serving base station's even second signal should
 2 be used. The base station simulator will be preset to start at the predetermined
 3 reference time value at the occurrence of the first even second pulse. The GNSS
 4 simulator will be preset to start $\Delta T_{GPS-GNSS}$ after the base station simulator starts.
 5 $\Delta T_{GPS-GNSS}$ is the GPS to GNSS system time offset. An advance in GPS system time
 6 relative to GNSS system time is represented by a positive $\Delta T_{GPS-GNSS}$ value.

7 The synchronization between the base station and the GNSS simulator shall meet the
 8 following minimum requirements:

- 9 ▪ Frequency offset between the base station and the GNSS simulator carriers (after
 10 frequency division to match the lower of the two frequencies) shall be less than ± 0.02
 11 ppm.
 12 ▪ Phase offset between the base station and the GNSS simulator carriers (after
 13 frequency division to match the lower of the two frequencies) shall be constant within
 14 ± 0.2 radians throughout the test.
 15 ▪ The timing offset between the serving base station and the GNSS simulator (i.e. the
 16 offset between CDMA and GNSS system time), referenced to the mobile station's
 17 antenna input, shall be less than ± 30 ns off from the value $\Delta T_{GPS-GNSS}$.

18 If the requirement regarding the timing offset is not met, the use the following method is
 19 permissible, unless specified otherwise in a test:

- 20 1. Connect a clock/counter to the serving base station's even second pulse output and the
 21 GNSS simulator's 1 PPS output, so that the clock measures the time difference between
 22 the active edges of the even second and the 1 PPS pulses. The clock/counter can use
 23 an internal time reference or, optionally, derive the internal time from the serving base
 24 station's or the GNSS simulator's 10 MHz signal.
 25 2. At the beginning of the measurement, record the measured time difference.
 26 3. Before evaluation, correct the pseudorange measurements or the clock bias returned by
 27 the mobile station with the measured offsets.

28 When using the method described above, the achieved synchronization shall meet the
 29 following minimum requirements:

- 30 ▪ The timing offset between the even second pulse and the 1 PPS pulse shall be less
 31 than ± 10 μ s.
 32 ▪ The timing offset between the even second signal and the 1 PPS signal shall be
 33 measured with accuracy better than ± 10 ns.

34 **6.9 AWGN Generator Equipment**

35 The AWGN generator shall meet the following minimum performance requirements:

- 36 ▪ Minimum bandwidth: 1.8 MHz for CDMA Spreading Rate 1. For the definition of
 37 Spreading Rate 1, see [2].

- 1 ▪ The frequency ranges¹⁸ are listed in Table 6.9-1.
- 2 ▪ The noise power spectral density level in the GPS and GNSS bands shall not exceed –
- 3 174 dBm/Hz at the mobile station antenna input.

4

5

Table 6.9-1 AWGN Generator Frequency Ranges

Band Class	Frequency Range (MHz)
0	864 to 899
1	1925 to 1985
2	912 to 965
3	827 to 875
4	1835 to 1875
5	416 to 499

6

7

- Frequency resolution: 10 kHz.

8

- Output accuracy: ±2 dB for outputs greater than or equal to -80 dBm/1.23 MHz.

9

- Amplitude resolution: 0.25 dB.

10

- Output range: -40 dBm/1.23 MHz to -95 dBm/1.23 MHz.

11

- The AWGN generator shall be uncorrelated to the ideal CDMA transmitter signals.

12

6.10 PDE Simulator Equipment

13

The PDE simulator equipment provides a uniform network assistance environment for every mobile station under test. Optionally, parts or all of the measurement data evaluation may also be carried out by the PDE simulator equipment.

14

15

16

The PDE simulator shall be capable to transmit and receive *Data Burst Messages* to and from the serving base station.

17

18

The PDE simulator shall recognize requests from the MS and shall appropriately respond to them. For this purpose, for tests that use *Position Determination Data Messages* with PD_MSG_TYPE='00000000', the PDE simulator shall be able to parse the received messages, extract the REQ_TYPE field and the COORD_TYPE field if REQ_TYPE = '0110' (Request GPS Location Assistance) and determine the time-of-arrival of the messages. The PDE simulator response will be solely determined by these three values, i.e. by the REQ_TYPE, COORD_TYPE and time-of-arrival of the request. These three values shall serve as indices into an array that stores all the PDE simulator responses. For tests that

19

20

21

22

23

24

25

¹⁸ The frequency ranges are based on covering the receive band and frequencies as great as 5 MHz outside the band.

1 use *Position Determination Data Messages* with PD_MSG_TYPE='00000010', the PDE
2 simulator shall be able to parse the received messages, extract the type of MS Request
3 Element and the "Coordinate type requested" field in the *Request GPS Location Assistance*
4 MS Request Element and determine the time-of-arrival of the messages. The PDE simulator
5 response will be solely determined by these three values, i.e. by the type of MS Request
6 Element, the value of "Coordinate type requested" field in the *Request GPS Location*
7 *Assistance* MS Request Element and time-of-arrival of the request. These three values shall
8 serve as indices into an array that stores all the PDE simulator responses.

9 The PDE simulator shall be capable of recording time-of-arrival of *Data Burst Messages*
10 sent by the mobile station. The PDE simulator shall also be capable of recording mobile
11 station response time, measured from the transmission of the end of the *Data Burst*
12 *Message* containing the PDE request element to the reception of the end of the *Data Burst*
13 *Message* containing the last part of the corresponding mobile station response element.

14 The PDE simulator shall meet the following minimum requirements:

- 15 ▪ The PDE simulator shall support messages corresponding to all PDE capabilities
- 16 ▪ Maximum Response time (measured from receipt of mobile station request): 200 ms
- 17 ▪ Internal Time accuracy (referenced to base station system time): ± 2 s
- 18 ▪ Maximal Internal clock drift: 10^{-4} s/s

19 The PDE simulator shall accept the following timing signal:

- 20 ▪ Even-second time mark.
- 21 ▪ Trigger representing the start of the power control bit sequence.

22 6.10.1 PDE Simulator Responses

23 The PDE simulator responses are presented in Annex E. In Annex A, a normative
24 description is given of the method of generating the PDE simulator responses.

25 6.10.2 *Position Determination Data Message* Call Flows

26 The PDE simulator shall adhere to the following call flows, based on the utilized Position
27 Location Test Mode (see 1.4):

28 For non-GNSS test cases in 2, 4 and 5, *Position Determination Data Messages* with
29 PD_MSG_TYPE = '00000000' or '00000010' shall be used:

- 30 1. Position Location Test Mode 1: The PDE simulator shall not send unsolicited response
31 messages. The PDE simulator shall send solicited response messages to all requests
32 received from the mobile station, according to 6.10.1, within the maximal response time
33 specified in 6.10. An example of a successful Test Mode 1 call flow is shown in Figure
34 6.10.2-1.
- 35 2. Position Location Test Mode 2: The PDE simulator shall not send unsolicited response
36 messages. The PDE simulator shall send solicited response messages to all requests
37 received from the mobile station, according to 6.10.1, within the maximal response time

1 specified in 6.10. An example of a successful Test Mode 2 call flow is shown in Figure
2 6.10.2-1.

- 3 3. Position Location Test Mode 3: The PDE simulator shall initiate a position location
4 session by sending a *Position Determination Data Message*, containing a *Request MS*
5 *Information* message on the Paging Channel. The base station shall use the Paging
6 Channel until the mobile station requests a dedicated channel. The base station shall
7 not initiate service negotiation in Position Location Test Mode 3. After receiving the
8 *Provide MS Information* response element, based on whether the mobile station is
9 capable of location calculation, the PDE simulator shall initiate one of the following two
10 call flows:

11 1. If the mobile station is capable of location calculation (at least one of bits 1-8 of
12 the LOC_CALC_CAP or “Position calculation capability” field¹⁹ of the *Provide MS*
13 *Information* response element is set to ‘1’), then the PDE simulator shall send a
14 *Request Location Response* message. Subsequent to that, the PDE simulator shall
15 not send unsolicited response messages. The PDE simulator shall send solicited
16 response messages to all requests received from the mobile station, according to
17 6.10.1, within the maximal response time specified in 6.10. An example of a
18 successful call flow is shown in Figure 6.10.2-2.

19 2. If the mobile station is not capable of location calculation (none of bits 1-8 of the
20 LOC_CALC_CAP or “Position calculation capability” field of the *Provide MS*
21 *Information* response element is set to ‘1’), then the PDE simulator shall send a
22 *Request Pseudorange Measurement* message, or a *Request Pilot Phase*
23 *Measurement* message, or both. Subsequent to that, the PDE simulator shall not
24 send unsolicited response messages. The PDE simulator shall send solicited
25 response messages to all requests received from the mobile station, according to
26 6.10.1, within the maximal response time specified in 6.10. An example of a
27 successful call flow is shown in Figure 6.10.2-3.

- 28 4. Position Location Test Mode 4: After the traffic channel assignment is indicated by the
29 serving base station, the PDE simulator shall initiate a position location session by
30 sending a *Position Determination Data Message*, containing a *Request MS Information*
31 message. After receiving the *Provide MS Information* response element, based on
32 whether the mobile station is capable of location calculation, the PDE simulator shall
33 initiate one of the following two call flows:

34 1. If the mobile station is capable of location calculation (at least one of bits 1-8 of
35 the LOC_CALC_CAP or “Position calculation capability” field of the *Provide MS*
36 *Information* response element is set to ‘1’), then the PDE simulator shall send a
37 *Request Location Response* message. Subsequent to that, the PDE simulator shall
38 not send unsolicited response messages. The PDE simulator shall send solicited
39 response messages to all requests received from the mobile station, according to

¹⁹ It is LOC_CALC_CAP if PD_MSG_TYPE='00000000' is used and it is “Position calculation capability” if PD_MSG_TYPE='00000010' is used.

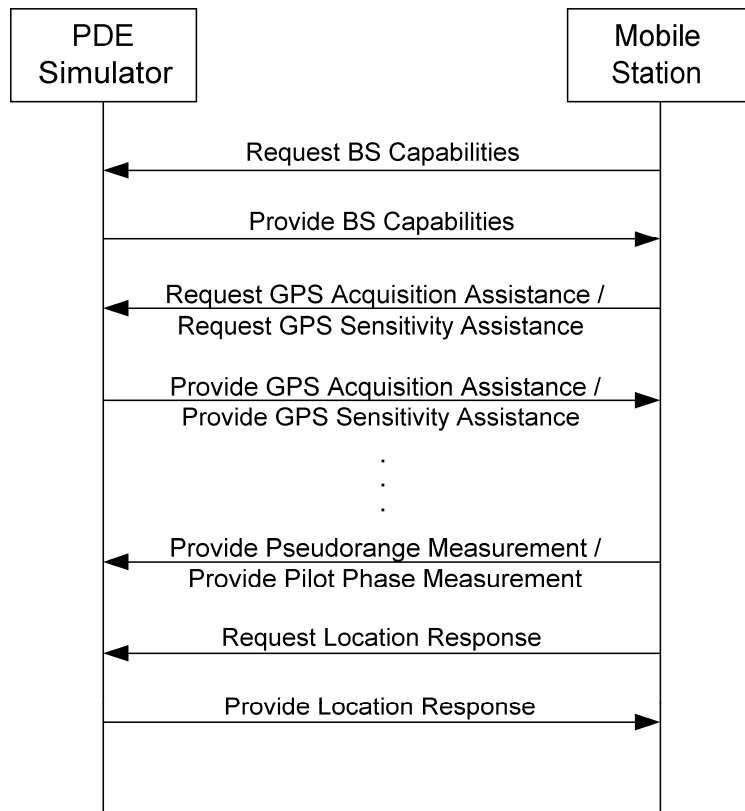

- 1 6.10.1, within the maximal response time specified in 6.10. An example of a
2 successful call flow is shown in Figure 6.10.2-2.
- 3 2. If the mobile station is not capable of location calculation (none of bits 1-8 of the
4 LOC_CALC_CAP or “Position calculation capability” field of the *Provide MS*
5 *Information* response element is set to ‘1’), then the PDE simulator shall send a
6 *Request Pseudorange Measurement* message or a *Request Pilot Phase Measurement*
7 message or both. Subsequent to that, the PDE simulator shall not send
8 unsolicited response messages. The PDE simulator shall send solicited response
9 messages to all requests received from the mobile station, according to 6.10.1,
10 within the maximal response time specified in 6.10. An example of a successful
11 call flow is shown in Figure 6.10.2-3.
- 12 For GNSS test cases, *Position Determination Data Messages* with PD_MSG_TYPE =
13 ‘00000010’ shall be used:
- 14 1. Position Location Test Mode 1: The PDE simulator shall not send unsolicited response
15 messages. The PDE simulator shall send solicited response messages to all requests
16 received from the mobile station, according to 6.10.1, within the maximal response time
17 specified in 6.10. An example of a successful Test Mode 1 call flow is shown in Figure
18 6.10.2-4 for the mobile station that is capable of location calculation (at least one of bits
19 3-5 and 7-9 of the “Position Calculation Capability” field of the *Provide Advanced MS*
20 *Information* response element is set to ‘1’). An example of a successful Test Mode 1 call
21 flow is shown in Figure 6.10.2-5 for the mobile station that is not capable of location
22 calculation (none of bits 3-5 and 7-9 of the “Position Calculation Capability” field of the
23 *Provide Advanced MS Information* response element is set to ‘1’).
- 24 2. Position Location Test Mode 2: The PDE simulator shall not send unsolicited response
25 messages. The PDE simulator shall send solicited response messages to all requests
26 received from the mobile station, according to 6.10.1, within the maximal response time
27 specified in 6.10. An example of a successful Test Mode 2 call flow is shown in Figure
28 6.10.2-4 for the mobile station that is capable of location calculation (at least one of bits
29 3-5 and 7-9 of the “Position Calculation Capability” field of the *Provide Advanced MS*
30 *Information* response element is set to ‘1’). An example of a successful Test Mode 2 call
31 flow is shown in Figure 6.10.2-5 for the mobile station that is not capable of location
32 calculation (none of bits 3-5 and 7-9 of the “Position Calculation Capability” field of the
33 *Provide Advanced MS Information* response element is set to ‘1’).
- 34 3. Position Location Test Mode 3: The PDE simulator shall initiate a position location
35 session by sending a *Position Determination Data Message*, containing a *Request*
36 *Advanced MS Information* message on the Paging Channel. The base station shall use
37 the Paging Channel until the mobile station requests a dedicated channel. The base
38 station shall not initiate service negotiation in Position Location Test Mode 3. After
39 receiving the *Provide Advanced MS Information* response element, the PDE simulator
40 shall send a *Request GNSS Pseudorange Measurement* message, or a *Request Pilot Phase*
41 *Measurement* message, or both. Subsequent to that, the PDE simulator shall send
42 solicited response messages to all requests received from the mobile station, according
43 to 6.10.1, within the maximal response time specified in 6.10. An example of a
44 successful call flow is shown in Figure 6.10.2-6.

- 1 4. Position Location Test Mode 4: After the traffic channel assignment is indicated by the
 2 serving base station, the PDE simulator shall initiate a position location session by
 3 sending a *Position Determination Data Message*, containing a *Request Advanced MS*
 4 *Information* message. After receiving the *Provide Advanced MS Information* message, the
 5 PDE simulator shall send a *Request GNSS Pseudorange Measurement* message, or a
 6 *Request Pilot Phase Measurement* message, or both. Subsequent to that, the PDE
 7 simulator shall send solicited response messages to all requests received from the
 8 mobile station, according to 6.10.1, within the maximal response time specified in 6.10.
 9 An example of a successful call flow is shown in Figure 6.10.2-6.

4 **6.11 MS Logging Entity**

5 The MS logging entity is essential for mobile station that is capable of calculating its
 6 position but does not return the final position to the network. The MS logging entity shall
 7 be used to log the position fixes generated by the mobile station that use the call flow
 8 indicated in Figure 6.10.2-4.

9 The MS logging entity could also be used to communicate with the mobile station on test-
 10 related matters such as preemption of assistance data such as Ephemeris, Almanac, or
 11 position results computed in the past.

12 The MS logging entity shall communicate with the mobile station using the asynchronous
 13 RS-232 protocol and standard Access Terminal (AT) comment mode via the serial port.

6 **6.12.2 General Comments**

7 The following comments apply to all tests:

- 8 1. The Forward CDMA Channel may be comprised of a Pilot Channel, a Sync Channel, a
- 9 Paging Channel, a Traffic Channel, and other orthogonal channels (OCNS).
- 10 2. For all base stations, use Pilot E_c/I_{or} equal to -7 dB.
- 11 3. For the serving base station, use Traffic E_c/I_{or} equal to -15 dB with 9600 bps data rate
- 12 (full rate, Rate Set 1).
- 13 4. For the serving base station, use Sync E_c/I_{or} equal to -16 dB and Paging E_c/I_{or} equal
- 14 to -12 dB with Paging Channel data rate at 9600 bps.

- 1 5. Adjust the OCNS gain such that the power ratios (E_c/I_{or}) of all specified forward
2 channels add up to one.
- 3 6. Pilot PN sequence offset indices are denoted by P_i ($i = 0, 1, 2, \dots$). The following
4 assumptions hold unless otherwise specified:
- 5 • $0 \leq P_i \leq 511$
- 6 • $P_i \neq P_j$ if $i \neq j$
- 7 • $P_i \bmod \text{PILOT_INC} = 0$
- 8 The chosen PN-sequence offset values shall be consistent with the parameter settings in
9 the base station overhead and PDE simulator GPS and GNSS assistance messages.
- 10 5. Base stations should be configured for normal operation as specified in [2], unless
11 specifically stated differently in a specific test.
- 12 6. All forward link power control bits from the base station shall be set to '0'.
- 13 7. For a mobile station with an integral antenna, the manufacturer shall provide a
14 calibrated RF coupling fixture to provide connection to the standard test equipment.
15 This applies to all the CDMA, GPS and GNSS antenna connections.
- 16 8. Unless specified otherwise in test procedures, if the mobile station supports turbo
17 coding on the Reverse Supplemental Channel, the test shall be performed with turbo
18 coding of the Reverse Supplemental Channel; otherwise, the mobile station shall use
19 convolutional coding of the Reverse Supplemental Channel.
- 20 9. Overhead message fields should be those needed for normal operation of the base
21 station, unless stated differently in Table 6.12.2-1 through Table 6.12.2-4 or in a
22 specific test.

1 **Annex A – METHOD OF GENERATING PDE SIMULATOR RESPONSES**

2 This Annex is normative.

3 **A.1 General Requirements for *Position Determination Data Message* Origination**

4 A.1.1 *Data Burst Message* Origination

5 The PDE simulator shall comply with the requirements of Section 3 of [1]. The PDE
6 simulator shall limit the *Data Burst Message* size to 200 bytes.

7 A.1.2 *Position Determination Data Message* Origination

8 The PDE simulator shall populate the *Position Determination Data Message* field according
9 to Section 3.2.4 of [1]. In particular, for Test Modes 1 and 2, the value assignments are
10 shown in Table A.1.2-1 if *Position Determination Data Messages* (PDDMs) with
11 PD_MSG_TYPE='00000000' are used and are shown in Table A.1.2-2 if PDDMs with
12 PD_MSG_TYPE='00000010' are used; for Test Modes 3 and 4, with a mobile station that is
13 capable of position calculation, the value assignments are shown in Table A.1.2-3 if PDDMs
14 with PD_MSG_TYPE='00000000' are used; and for Test Modes 3 and 4, with a mobile
15 station that is not capable of position calculation, the value assignments are shown in
16 Table A.1.2-4 if PDDMs with PD_MSG_TYPE='00000000' are used; and for Test Modes 3
17 and 4, the value assignments are shown in Table A.1.2-5 if PDDMs with
18 PD_MSG_TYPE='00000010' are used.

19

PDU	As specified in [1]
-----	---------------------

3

4 A.1.3 Position Determination Data Message Segmentation

5 The PDE simulator shall divide messages into parts as necessary in order to meet the
 6 requirement listed in A.1.1. The message segmentation shall be performed according to the
 7 requirements listed in Section 3.2.2.1 of [1].

8 A.2 Method of Selecting the PDE Simulator Response Message

9 The PDE simulator shall respond to requests received from the mobile station by sending
 10 the corresponding response messages. The response messages are presented in Annex E for
 11 *Position Determination Data Messages* with PD_MSG_TYPE='00000000'. If *Position*
 12 *Determination Data Messages* with PD_MSG_TYPE='00000000' are used, the PDE simulator
 13 shall select the response message based on the received REQ_TYPE and COORD_TYPE, if
 14 REQ_TYPE = '0110' (*Request GPS Location Assistance*), and the time-of-arrival of the mobile
 15 station request. If *Position Determination Data Messages* with PD_MSG_TYPE='0000010'
 16 are used, the PDE simulator shall select the response message based on the received type
 17 of MS Request Element and the received value of "Coordinate type requested" field in the
 18 *Request GPS Location Assistance* MS Request Element, and the time-of-arrival of the mobile
 19 station request.

20 A.2.1 PDE Simulator Response Type

21 When responding to a mobile station request for which the *Position Determination Data*
 22 *Messages* with PD_MSG_TYPE='00000000' are used, the PDE response type shall be
 23 determined by the received REQ_TYPE and COORD_TYPE, if REQ_TYPE = '0110' (*Request*
 24 *GPS Location Assistance*) as listed in Table A.2.1-1.

25

1

2 A.2.2 PDE Simulator Response Reference Time

3 When responding to a mobile station request, the PDE simulator shall determine the
4 response reference time based on the time-of-arrival of the request and the stepsize for the
5 response time. The stepsize for the response time here means the time step between
6 consecutive response messages of the same type contained in Annex E. The number of
7 possible PDE simulator response messages for a given message type is obtained by dividing
8 the maximal supported test duration by the resolution of the reference time for that
9 message type. For message types for which Table A.2.2-1 and Table A.2.2-2 list 'N/A' as
10 resolution of reference time, there is only one possible PDE simulator response. The PDE
11 simulator shall support maximal test duration of at least 60 minutes for non-GNSS test
12 cases in 2, 4 and 5 and shall support test duration of 15 minutes for GNSS test cases in 3.

13

1
2**Table A.2.2-1 PDE Simulator Response Reference Time Information for Non-GNSS Test Cases**

PDE Response	Reference Time Field	Stepsize for Response Time	Selection of Reference Time Note: t_{ref} = Reference Time, t_{req} = Time-of-Arrival of Mobile Station Request
<i>Provide BS Capabilities</i>	N/A	N/A	N/A
<i>Provide GPS Acquisition Assistance</i>	TIME_OF_APP or “CDMA system time at the time when the acquisition assistance data is applicable”	1.28 s	$t_{req} + 2 \leq t_{ref} < t_{req} + 3.28$
<i>Provide GPS Location Assistance – Cartesian</i>	Implicit	1.28 s	Same as in <i>Provide GPS Acquisition Assistance</i> message

1 **A.3 Method of Determining the PDE Simulator Response Values**

2 A.3.1 Setting of PDE Simulator Response Field Counters

3 For tests that use PDDMs with PD_MSG_TYPE='00000000', the PDE simulator shall set the
4 field counters as listed in Table A.3.1-1.

5 The values of fields PART_NUM and TOTAL_PARTS, when applicable, shall be set by the
6 PDE simulator according to A.1.3.

7

1

Table A.3.1-1 PDE Simulator Response Field Counter Settings

PDE Response	Field Counter	Value (Binary)	Total Number in All Parts of the Response
<i>Provide GPS Acquisition Assistance</i>	NUM_SV	Number of SVs above 18° elevation angle – 1 = '1000'	No segmentation
	DOPP_INCL	'1'	N/A
	ADD_DOPP_INCL	'1'	N/A
	CODE_PH_PAR_INCL	'1'	N/A
	AZ_EL_INCL	'1'	N/A
<i>Provide GPS Location Assistance – Cartesian</i>	NUM_DLY	'000'	No segmentation
	NUM_SV	Same as in <i>Provide GPS Acquisition Assistance</i> message	No segmentation
<i>Provide GPS Location Assistance – Spherical</i>	NUM_DLY	'000'	No segmentation
	NUM_SV	Same as in <i>Provide GPS Acquisition Assistance</i> message	No segmentation
<i>Provide GPS Sensitivity Assistance</i>	NUM_DR_P	As needed	Number of SVs above 18° elevation angle = 9
	DR_SIZE	'11111111'	N/A
	NUM_SV_DR	'0'	N/A
<i>Provide Base Station Almanac</i>	NUM_PILOTS_P	'000001001'	No segmentation
	LOC_SAME_AS_PREV	'0'	N/A
<i>Provide GPS Almanac</i>	NUM_SV_P	As needed	Number of SVs in reference Almanac = 26
<i>Provide GPS Ephemeris</i>	NUM_SV_P	As needed	Number of SVs above 18° elevation angle = 9
	AB_PAR_INCL	'1'	N/A
<i>Provide GPS Navigation Message Bits</i>	NUM_SV_P	As needed	Number of SVs above 18° elevation angle = 9
	SUBF_4_5_INCL	'0'	N/A
<i>Provide</i>	VELOCITY_INCL	'0'	N/A

<i>Location Response</i>	CLOCK_INCL	'0'	N/A
	HEIGHT_INCL	'1'	N/A
<i>Provide GPS Almanac Correction</i>	NUM_SV_P	Number of SVs above 18° elevation angle – 1 = '1000'	No segmentation
	DELTA_XYZ_INCL	'1'	N/A
	DELTA_CLOCK_INCL	'1'	N/A
<i>Provide GPS Satellite Health Information</i>	BAD_SV_PRESENT	'0'	N/A

1

2 For tests that use PDDMs with PD_MSG_TYPE='00000010', the PDE simulator shall use
3 the ASN.1 encoding to provide the GNSS assistance data for the intended number of GNSS
4 satellites as specified in A.1. The values of fields "Part number" and "Total number of
5 parts", when applicable, shall be set by the PDE simulator according to A.1.3.

6

7 A.3.2 Calculating of PDE Simulator Numerical Parameter Values

8 The PDE simulator response numerical data values shall be calculated according to the
9 definitions of Section 2.5 of [7] as well as [17~2323], and Sections 3.2.4.2 and 3.2.4.3.2 of
10 [1].

11 Furthermore, the following procedures shall apply:

- 12 ▪ Pseudorange, Doppler and Doppler rate of change values shall be calculated
13 according to [17~23], based on the reference Ephemeris. Ionospheric and
14 tropospheric corrections shall be applied as described in [17~23]. The serving base
15 station's location shall be used as the reference location, and the time indicated by
16 TIME_OF_APP or "CDMA system time at the time when the acquisition assistance
17 data is applicable" in the *Provide Acquisition Assistance* message or indicated by
18 "Reference time" in the *Provide GNSS Acquisition Assistance* message shall be used as
19 the reference time. Location coordinates shall be interpreted according to [3]. The
20 rounding or truncation of the resulting values shall be carried out according to
21 Sections 3.2.4.2 and 3.2.4.3.2 of [1].
- 22 ▪ The GPS and GNSS Almanac, Ephemeris and navigation bit data shall be set
23 according to the GPS and GNSS simulator data, respectively.

24 A.3.3 Setting of PDE Simulator Response Information Parameters

25 Unless otherwise indicated in specific tests, the PDE simulator shall set the response
26 information parameters according to Table A.3.3-1.

1 The parameter values included in the *Provide Location Response* or the *Provide Advanced*
2 *Location Response* message were determined based on the assumption that the message
3 may be sent as assistance to the mobile station before any measurements are made. The
4 same *Provide Location Response* or the *Provide Advanced Location Response* message shall
5 be sent by the PDE simulator to the mobile station regardless of whether it is requested
6 before or after any measurements are made; thus, it does not reflect the positioning
7 accuracy that could be obtained from the measurements.

1

Table A.3.3-1 PDE Simulator Response Information Parameters

PDE Response	Field	Value (Binary)
<i>Provide BS Capabilities</i>	BS_LS_REV or “Base station location standard revision number”	‘000000’
	GPSC_ID or “GPS capability indicator”	‘1’
	AFLTC_ID or “Advanced forward link trilateration capability indicator”	‘1’
	APDC_ID or “Autonomous position determination capability indicator”	‘00000000’
<i>Reject</i>	REJ_REQ_TYPE or “Reject request type”	As needed, same as in MS request
	REJ_REASON or “Reject reason”	‘001’
<i>Provide GPS Acquisition Assistance</i>	REFERENCE_PN or “Reference PN”	P ₀
	SV_CODE_PH_WIN or “Code phase window”	‘01011’
	DOPPLER_WIN or “Doppler search window”	‘100’
<i>Provide Base Station Almanac</i>	TIME_CRRCTION_RE F or “Reference time correction”	‘010111101’
	TIME_CORRECTION or “Reference time correction” within Data record	‘010111101’
<i>Provide Location Response</i>	FIX_TYPE or “Fix type”	‘1’
<i>Provide Advanced BS Capabilities</i>	“BS location rev number”	‘2’
	“Supported GNSS”	As needed

	“AFLT capability indicator”	‘0000000000xxxx 1x’ ²⁰
<i>Advanced Reject</i>	“Reject request type”	As needed, same as in MS request
	“Reject reason”	‘1’
<i>Provide GNSS Acquisition Assistance</i>	“Pilot PN sequence offset”	P ₀
	“Code phase search window”	‘11’
	“Doppler search window”	‘4’
<i>Provide Advanced Location Response</i>	“Fix type”	As needed

1

2 A.3.4 Setting of PDE Simulator Request Information Parameters

3 Unless otherwise indicated in specific tests, the PDE simulator shall set the request
4 information parameters according to Table A.3.4-1.

5

²⁰ ‘x’ means don’t care.

1

Table A.3.4-1 PDE Simulator Request Information Parameters

PDE Request	Field	Value (Binary)
<i>Request Pseudorange Measurement</i>	PREF_RESP_QUAL or “Preferred response quality”	‘100’ for GPS Dynamic Range Test, ‘011’ otherwise
	NUM_FIXES or “Number of fixes”	‘00000000’
	T_BETW_FIXES or “Time between fixes”	‘00010000’
	OFFSET_REQ or “Offset requested”	‘1’
<i>Request Pilot Phase Measurement</i>	PREF_RESP_QUAL or “Preferred response quality”	‘011’ for AFLT Protocol Tests, ‘010’ otherwise
	NUM_FIXES or “Number of fixes”	‘00000000’
	T_BETW_FIXES or “Time between fixes”	‘00010000’
	OFFSET_REQ or “Offset requested”	‘1’
	DESI_PIL_PH_RES or “Desired pilot phase resolution”	‘1’
<i>Request Location Response</i>	PREF_RESP_QUAL or “Preferred response quality”	‘010’ for AFLT Tests, ‘011’ for GPS and Hybrid Tests
	NUM_FIXES or “Number of fixes”	‘00000000’
	T_BETW_FIXES or “Time between fixes”	‘00010000’
	HEIGHT_REQ or “Height information requested”	‘1’
	CLK_COR_GPS_REQ or “Clock correction for GPS time requested”	‘1’
	VELOCITY_REQ or “Velocity information requested”	‘1’

<i>Request GNSS Pseudorange Measurement</i>	“Preferred response quality”	‘100’ for GNSS Dynamic Range Test, ‘011’ for other GNSS Tests
	“Number of fixes”	‘1’
	“Time between fixes”	‘16’
<i>Request Advanced Location Response</i>	“Maximum response time”	‘100’ for all GNSS Tests
	“Number of fixes”	‘1’
	“Time between fixes”	‘18’
	“Height information request”	‘1’
	“Clock correction for GPS time request”	‘1’
	“Horizontal velocity information request”	‘1’
	“Vertical velocity information request”	‘1’

1

2

1 **Annex B – REFERENCE GPS NAVIGATION DATA, SYSTEM TIME AND USER LOCATION**

2 This Annex is normative.

3 **B.1 Reference Location**

4 For all tests defined in this document, the PDE simulator response messages shall be
5 consistent with (i.e. all assistance data shall be valid at) the following reference location:

- 6 ▪ Lat: + 37° 00' 00.0000"
- 7 ▪ Lon: - 122° 00' 00.0000"
- 8 ▪ Height: + 100.00 m (above the WGS-84 Reference Ellipsoid)

9 **B.2 Reference Time**

10 For all tests defined in this document, the reference time (start time of the test) shall be as
11 follows:

- 12 ▪ GPS Time: Week 1127 (WIN:0103), TOW: 320320 (Wednesday, 16:58:40)
- 13 ▪ Local Time (Pacific Standard Time): 2001 August 15, 08:58:27 am
- 14 ▪ Local Time (Pacific Daylight Time): 2001 August 15, 09:58:27 am

15 The test equipment shall support a test duration of 1 hour.

16 **B.3 Reference Ephemeris**

17 For all tests defined in this document, the following reference Ephemeris data shall be
18 used. Note that the first number after the parameter name is the binary value of the
19 corresponding message field defined in [1]; the second number (in parentheses) is the
20 scaling factor expressed in powers of two; and the third number is the floating-point
21 representation. For the applicable units, see [17]. Note that the IODE values shown below
22 are not mandatory. Any IODE value can be used, as long as the PDE simulator response
23 messages (see Annex E) are kept consistent with the settings of the GPS simulator.

38 **B.4 Reference Almanac**

39 For all tests defined in this document, the following reference Almanac data shall be used.
40 Note that the first number after the parameter name is the binary value of the
41 corresponding message field defined in [1]; the second number (in parentheses) is the
42 scaling factor expressed in powers of two; and the third number is the floating-point
43 representation. For the applicable units, see [17].

40 **B.5 List of Active Satellites**

41 Assistance shall be provided in all tests for the satellites having the following PRN numbers:

42 3, 14, 15, 17, 18, 21, 23, 29, 31

43 Satellites identified with the following PRN numbers shall be simulated in the tests:

- 1 1. GPS Accuracy, GPS Dynamic Range, GPS Moving Scenario and GPS Protocol Tests:
2 3, 14, 15, 17, 18, 21, 29, 31
- 3 2. GPS Sensitivity Test:
4 14, 17, 21, 31
- 5 3. GPS Multipath Accuracy Test:
6 14, 17, 18, 21, 31
- 7 4. One Base Station + Three Satellites Hybrid Test:
8 14, 17, 31
- 9 5. Two Base Stations + One Satellite Hybrid Test:
10 3

11 **B.6 Simulated Base Station Locations**

12 For all tests defined in this document, the simulated base station locations shall be as
13 follows:

- 14 1. Base Station 1:
 - 15 ▪ Lat: + 37° 00' 00.0000"
 - 16 ▪ Lon: - 122° 00' 00.0000"
 - 17 ▪ Height: + 150.00 m (above the WGS-84 Reference Ellipsoid)
- 18 2. Base Station 2:
 - 19 ▪ Lat: + 36° 57' 39.5249"
 - 20 ▪ Lon: - 121° 58' 18.9429"
 - 21 ▪ Height: + 150.00 m (above the WGS-84 Reference Ellipsoid)
- 22 3. Base Station 3:
 - 23 ▪ Lat: + 36° 57' 39.5249"
 - 24 ▪ Lon: - 122° 01' 41.0571"
 - 25 ▪ Height: + 150.00 m (above the WGS-84 Reference Ellipsoid)

26 **B.7 Simulated Mobile Station Locations**

27 The simulated mobile station locations shall be as follows:

- 28 1. GPS Accuracy, GPS Sensitivity, GPS Dynamic Range and GPS Multipath Tests:
 - 29 ▪ Lat: + 36° 58' 26.3580"
 - 30 ▪ Lon: - 122° 00' 00.0000"
 - 31 ▪ Height: + 115.00 m (above the WGS-84 Reference Ellipsoid)
- 32 2. GPS Moving Scenario Test:

1 The mobile station's trajectory is a circle in the horizontal plane, with a radius of
2 1 km, centered at the following location:

- 3 ▪ Lat: + 37° 00' 00.0000"
- 4 ▪ Lon: - 122° 00' 00.0000"
- 5 ▪ Height: + 115.00 m (above the WGS-84 Reference Ellipsoid)

6 The mobile station's initial position at reference time (see B.2) shall be set as
7 follows:

- 8 ▪ Lat: + 36° 59' 27.5618"
- 9 ▪ Lon: - 122° 00' 00.0000"
- 10 ▪ Height: + 115.00 m (above the WGS-84 Reference Ellipsoid)

11 The mobile station's velocity is constant at 100 km/h, with an initial heading of
12 -90° at reference time (see B.2).

13 3. GPS Protocol, all AFLT and Hybrid Tests:

- 14 ▪ Lat: + 36° 58' 26.3580"
- 15 ▪ Lon: - 122° 00' 00.0000"
- 16 ▪ Height: + 115.00 m (above the WGS-84 Reference Ellipsoid)

17 **B.8 Additional GPS Simulator Settings**

18 The settings shown in Table B.8-1 are also applied in the GPS simulator set-up. Note that
19 the IODE and IODC values shown in Table B.8-1 are not mandatory. Any IODE or IODC
20 value can be used, as long as the PDE simulator response messages (see Annex E) are kept
21 consistent with the settings of the GPS simulator.

22

1 Notes for Table B.8-1:

2 1. The interpretation of URA is as follows:

3 0 : >2 m

4 1 : >2.8 m

5 2 : >4 m

6 2. The interpretation of SV Health in Frame 25 is as follows:

7 '000000': All Signals OK

8 '111111': Satellite not present

9 3. The interpretation of SV Health in valid Almanac frames is as follows:

10 '00000000': All Data and Signals OK

11 4. The interpretation of Satellite Configuration is as follows:

12 '0001': Block 2 satellite

13

- 1 This page intentionally left blank.
- 2

1 **Annex C – REFERENCE GNSS NAVIGATION DATA, SYSTEM TIME AND USER**
 2 **LOCATION**

3 This Annex is normative.

4 **C.1 Reference Location**

5 For all GNSS tests defined in this document, the PDE simulator response messages shall be
 6 consistent with (i.e. all assistance data shall be valid at) the following reference location:

- 7 ▪ Lat: + 37° 22' 00.0000"
- 8 ▪ Lon: - 121° 59' 00.0000"
- 9 ▪ Height: + 100.00 m (above the WGS-84 Reference Ellipsoid)

10 **C.2 Reference Time**

11 For all GNSS tests defined in this document, the reference time (start time of the test) shall
 12 be as follows:

- 13 ▪ GPS Time: Week 1557 (WIN:0533), TOW: 225015 (Tuesday, 14:30:15)
- 14 ▪ Local Time (Pacific Standard Time): 2009 November 10, 06:30:00 am
- 15 ▪ Local Time (Pacific Daylight Time): 2009 November 10, 07:30:00 am
- 16 ▪ Delta between GPS and GLONASS time $\Delta T_{GPS-GLONASS}$: tau_gps - 3 hours + 15
 17 seconds
- 18 ▪ Delta between GPS and Galileo time $\Delta T_{GPS-Galileo}$: Not specified
- 19 ▪ Delta between GPS and QZSS time $\Delta T_{GPS-QZSS}$: Not specified
- 20 ▪ Delta between GPS and SBAS time $\Delta T_{GPS-SBAS}$: Not specified

21 The test equipment shall support a test duration of 15 minutes. The test equipment shall
 22 restart from the reference time every 15 minutes if the overall test duration runs over.

23 **C.3 Reference GPS Ephemeris**

24 For all GNSS tests defined in this document, the following GPS reference Ephemeris data
 25 shall be used. Note that the first number after the parameter name is the binary value of
 26 the corresponding message field defined in [1]; the second number (in parentheses) is the
 27 scaling factor expressed in powers of two; and the third number is the floating-point
 28 representation. For the applicable units, see [17]. Note that the IODE values shown below
 29 are not mandatory. Any IODE value can be used, as long as the PDE simulator response
 30 messages are kept consistent with the settings of the GPS simulator.

2 **C.4 Reference GPS Almanac**

3 For all GNSS tests defined in this document, the following reference GPS Almanac data
4 shall be used. Note that the first number after the parameter name is the binary value of

1 the corresponding message field defined in [1]; the second number (in parentheses) is the
 2 scaling factor expressed in powers of two; and the third number is the floating-point
 3 representation. For the applicable units, see [17].

2 **C.6 Reference GLONASS Almanac**

3 For all GNSS tests defined in this document, the following reference Almanac data shall be
 4 used. Note that the first number after the parameter name is the binary value of the
 5 corresponding message field defined in [1]; the second number (in parentheses) is the
 6 scaling factor expressed in powers of two; and the third number is the floating-point
 7 representation. For the applicable units, see [2222].

2 **C.7 Reference Ephemeris of Galileo**

3 Reference Ephemeris of the Galileo is not specified.

1 **C.8 Reference Almanac of Galileo**

2 Reference Almanac of the Galileo is not specified.

3 **C.9 Reference Ephemeris of QZSS**

4 Reference Ephemeris of the QZSS is not specified.

5 **C.10 Reference Almanac of QZSS**

6 Reference Almanac of the QZSS is not specified.

7 **C.11 Reference Ephemeris of SBAS**

8 Reference Ephemeris of the SBAS is not specified.

9 **C.12 Reference Almanac of SBAS**

10 Reference Almanac of the SBAS is not specified.

11 **C.13 List of Active Satellites**

12 Assistance shall be provided in all GNSS tests for the satellites of the specific GNSS under
13 test and having the following PRN numbers:

14 GPS: 5, 7, 10, 11, 13, 15, 17

15 GLONASS: 7, 8, 9, 10, 18, 19, 20

16 Galileo: Not specified

17 QZSS: Not specified

18 SBAS: Not specified

19 GPS and GLONASS satellites simulated for the GNSS Accuracy test, GNSS Sensitivity test
20 and GNSS Moving Scenario test are listed in Table C.13-1.

21 **Table C.13-1 GPS and GLONASS Satellites Simulated for GNSS Accuracy, GNSS**
22 **Sensitivity and GNSS Moving Scenario Tests**

	Satellite allocation for GPS and GLONASS constellations	
	GPS	GLONASS
Single constellation	5, 7, 10, 13, 15, 17	7, 8, 9, 10, 18, 19
Dual constellation (GPS + GLONASS)	7, 10, 17	8, 9, 18

23 Satellites of Galileo, QZSS and SBAS simulated for the GNSS Accuracy, GNSS Sensitivity
24 and GNSS Moving Scenario tests are not specified.

25

1 GPS and GLONASS satellites simulated for the GNSS Dynamic Range test are listed in
 2 Table C.13-2.

3 **Table C.13-2 GPS and GLONASS Satellites Simulated for GNSS Dynamic Range Test**

		Satellite allocation for GPS and GLONASS constellations	
		GPS	GLONASS
Single constellation	High signal	7, 17	9, 19
	Low signal	5, 10, 13, 15	7, 8, 10, 18
Dual constellation (GPS + GLONASS)	High signal	7	9
	Low signal	10, 17	8, 18

4 Satellites of Galileo, QZSS and SBAS simulated for the GNSS Dynamic Range test are not
 5 specified.

6

7 GPS and GLONASS satellites simulated for the GNSS Multipath test are listed in Table
 8 C.13-3.

9 **Table C.13-3 GPS and GLONASS Satellites Simulated for GNSS Multipath Test**

		Satellite allocation for GPS and GLONASS constellations	
		GPS	GLONASS
Single constellation	LOS-only SVs	7, 17	9, 19
	SVs with LOS & Multipath	5, 10, 13, 15	7, 8, 10, 18
Dual constellation (GPS + GLONASS)	LOS-only SVs	7	9
	SVs with LOS & Multipath	10, 17	8, 18

10 Satellites of Galileo, QZSS and SBAS simulated for the GNSS Multipath test are not
 11 specified.

12 **C.14 Simulated Base Station Locations**

13 For all GNSS tests defined in this document, the simulated base station locations shall be
 14 as follows:

15 1. Base Station 1:

16 ▪ Lat: + 37° 22' 00.0000"

17 ▪ Lon: - 121° 59' 00.0000"

18 ▪ Height: + 150.00 m (above the WGS-84 Reference Ellipsoid)

- 1 2. Base Station 2:
- 2 ▪ Lat: + 37° 19' 39.5313"
- 3 ▪ Lon: - 121° 57' 18.4523"
- 4 ▪ Height: + 150.00 m (above the WGS-84 Reference Ellipsoid)
- 5 3. Base Station 3:
- 6 ▪ Lat: + 37° 19' 39.5313"
- 7 ▪ Lon: - 122° 00' 41.5477"
- 8 ▪ Height: + 150.00 m (above the WGS-84 Reference Ellipsoid)

9 **C.15 Simulated Mobile Station Locations**

10 The simulated mobile station locations shall be as follows:

- 11 1. GNSS Accuracy, GNSS Sensitivity, GNSS Dynamic Range and GNSS Multipath
12 Tests:
- 13 ▪ Lat: + 37° 20' 26.3624"
- 14 ▪ Lon: - 121° 59' 00.00"
- 15 ▪ Height: + 115.00 m (above the WGS-84 Reference Ellipsoid)
- 16 2. GNSS Moving Scenario Test:
- 17 The mobile station's trajectory is a circle in the horizontal plane, with a radius of
18 1 km, centered at the following location:
- 19 ▪ Lat: + 37° 22' 00.0000"
- 20 ▪ Lon: - 121° 59' 00.0000"
- 21 ▪ Height: + 115.00 m (above the WGS-84 Reference Ellipsoid)
- 22 The mobile station's initial position at reference time (see B.2) shall be set as
23 follows:
- 24 ▪ Lat: + 37° 21' 27.5630"
- 25 ▪ Lon: - 121° 59' 00.0000"
- 26 ▪ Height: + 115.00 m (above the WGS-84 Reference Ellipsoid)
- 27 The mobile station's velocity is constant at 100 km/h, with an initial heading of
28 -90° at reference time (see C.2).

29 **C.16 Additional GNSS Simulator Settings**

30 The settings shown in Table C.16-1 for GPS are also applied in the GNSS simulator set-up
31 for all GNSS testings. Note that the IODE and IODC values shown in Table C.16-1 are not
32 mandatory. Any IODE or IODC value can be used, as long as the PDE simulator response
33 messages are kept consistent with the settings of the GNSS simulator.

34

1 Notes for Table C.16-1:

2 1. The interpretation of URA is as follows:

3 0 : >2 m

4 1 : >2.8 m

5 2 : >4 m

6 2. The interpretation of SV Health in Frame 25 is as follows:

7 '000000': All Signals OK

8 '111111': Satellite not present

9 3. The interpretation of SV Health in valid Almanac frames is as follows:

10 '00000000': All Data and Signals OK

11 4. The interpretation of Satellite Configuration is as follows:

12 '0001': Block II/IIA/IIR satellite

13 '0010': Block IIR-M satellite

1 **Annex D – METHOD OF STATISTICAL CONFIDENCE DETERMINATION**

2 This Annex is normative.

3 The statistical approach, proposed by FCC [6] as well as the 80% statistical value,, will be
4 used to determine whether or not a set of measurement errors resulting from a finite set of
5 measurements demonstrate a specified accuracy with a specified confidence. Other
6 equivalent methods can also be used to demonstrate such accuracy.

7 **D.1 Description of the Confidence Determination Method**

8 A method for determining whether or not a set of location errors resulting from empirical
9 testing demonstrates compliance may be obtained from order statistics. Confidence
10 intervals for a specified accuracy may be selected based on a certain confidence level (for
11 example, 90% for FCC) and the number of samples. These confidence intervals are not
12 based on any knowledge of the actual probability distribution function of the location
13 errors. They are expressed in terms of the subscripts of the list of location errors after
14 ordering these errors from smallest to largest. A specific set of accuracy measurements is
15 said to show compliance if the confidence intervals contain the location error thresholds
16 that may be specified by a Standards Development Organization. For example, the error
17 thresholds are 100 meters for 67% and 300 meters for 95% for network-based solutions, or
18 50 meters and 150 meters, respectively for handset-based solutions, as specified by the
19 FCC ruling [24].

20 In general, when the number of measurements is n , the r^{th} and s^{th} largest measurements
21 are x_r and y_s respectively, and x and y are the percentile points associated with probabilities
22 p_1 and p_2 respectively, then the probability that x is less than x_r while simultaneously y is
23 less than y_s is given by the formula

$$24 \quad \text{Confidence}(x \leq x_r, y \leq y_s; n, r, s, p_1, p_2) = \sum_{i=0}^{r-1} \sum_{j=i}^{s-1} \binom{n}{i} \binom{n-i}{n-j} p_1^i (p_2 - p_1)^{j-i} (1 - p_2)^{n-j}.$$

25 For example, p_1 is 0.67, and p_2 is 0.95 for the FCC ruling [5, 6]. Additionally, p_1 is 0.67,
26 and p_2 is 0.8 for the pseudorange measurement in the GNSS Dynamic Range Test in 3.

27 Upper bounds on the percentile points can be determined from this expression by finding
28 pairs of values (r, s) such that the desired 90% confidence level is achieved. Using the 67%
29 and 95% numbers in FCC ruling as an example, the resulting pair of ordered samples (x_r ,
30 y_s) forms one-sided confidence intervals for the two sample percentile points associated
31 with 67% and 95%, respectively (see Table D.1-1). The r^{th} sample x_r and s^{th} sample y_s of n
32 location errors are then compared with 100 meters and 300 meters for the networked-
33 based solutions or with 50 meters and 150 meters for the handset-based solutions. If the
34 r^{th} ordered sample is less than 100 meters and the s^{th} ordered sample is less than 300
35 meters, then the confidence intervals are found to cover the desired values and compliance
36 would be established, for networked-based solutions. A similar approach would establish
37 compliance for a set of location errors obtained from a test of a handset-based solution.

1 The confidence level of 90% is suggested here as a threshold, and the value calculated from
 2 the actual data may be greater. Table D.1-1 is derived from the above confidence
 3 expression and shows for several sample sizes which ordered samples of errors should be
 4 compared with the FCC criteria. For higher numbers of sample sizes such as 500 or 1000,
 5 the confidence expression should be re-calculated with the higher value of n .

6 Confidence in the compliance assessment is important and will depend on randomness and
 7 independence in the selection of test locations. Reports of compliance testing should
 8 describe the method used to guarantee random and independent accuracy measurements.

9

10 **Table D.1-1 Identification of Location Error Samples for Comparison with FCC**
 11 **Required Thresholds of 67% and 95% (at the 90% Confidence Level)**

Sample Size	Pairs of Test Samples	
	45	(x_{40}, y_{45})
	50	(x_{41}, y_{50})
	55	(x_{44}, y_{55})
	60	(x_{47}, y_{60})
	65	(x_{50}, y_{65})
	70	(x_{53}, y_{70})
	75	(x_{57}, y_{75})
	80	(x_{60}, y_{80}) or (x_{63}, y_{79})
	85	(x_{64}, y_{85}) or (x_{66}, y_{84})
	90	(x_{67}, y_{90}) or (x_{68}, y_{89})
	95	(x_{71}, y_{95}) or (x_{72}, y_{94})
	100	(x_{74}, y_{100}) or (x_{75}, y_{99})

12

13 Table D.1-2 shows the corresponding test samples with thresholds of 67% and 80% at 90%
 14 confidence level that can be used for the pseudorange measurement in the GNSS Dynamic
 15 Range Test in 3.1.1.2. For higher numbers of sample sizes such as 500 or 1000, the
 16 confidence expression should be re-calculated with the higher value of n .

17

18 **Table D.1-2 Identification of Location Error Samples With Thresholds of 67% and**
 19 **80% (at the 90% Confidence Level)**

Sample Size	Pairs of Test Samples	
	45	(x_{35}, y_{41}) or (x_{37}, y_{40})
	50	(x_{39}, y_{45})

55	(x_{42}, y_{50}) or (x_{43}, y_{49})
60	(x_{46}, y_{54}) or (x_{47}, y_{53})
65	(x_{49}, y_{59}) or (x_{50}, y_{58}) or (x_{51}, y_{57})
70	(x_{53}, y_{62}) or (x_{55}, y_{61})
75	(x_{56}, y_{68}) or (x_{57}, y_{66}) or (x_{59}, y_{65})
80	(x_{60}, y_{71}) or (x_{61}, y_{70})
85	(x_{63}, y_{78}) or (x_{64}, y_{74})
90	(x_{67}, y_{79}) or (x_{68}, y_{78})
95	(x_{70}, y_{87}) or (x_{71}, y_{83}) or (x_{72}, y_{82})
100	(x_{74}, y_{88}) or (x_{75}, y_{87}) or (x_{76}, y_{86})

1

2 **D.2 Evaluation Example**

3 In the following, an example is given for the 67% and 95% statistical values. A handset-
4 based solution would be found in compliance, if, in a test of 75 accuracy measurements,
5 the 57th largest location error is less than 50 meters and the 75th largest error is less than
6 150 meters. Note that for larger sample sizes the pair of test samples is not unique,
7 because of the statistical dependence of the 67% and 95% levels. For example, for a
8 sample size of 80, two pairs are shown; the 67% level could be increased from the 60th to
9 the 63rd sample, (i.e., made more difficult), if the 95% level test were relaxed to the 79th
10 largest sample. Either (x_{60}, y_{80}) or (x_{63}, y_{79}) is an acceptable pair to test against the FCC-
11 required thresholds.

Annex E PDE SIMULATOR RESPONSE MESSAGES

This Annex is normative.

The PDE simulator response messages are included in the attached files.

1. Annex D Acquisition.txt 636 KB 01/21/2002
2. Annex D Almanac.txt 2 KB 01/21/2002
3. Annex D BSAlmanac.txt 1 KB 01/21/2002
4. Annex D BSCapabilities.txt 1 KB 01/21/2002
5. Annex D Ephemeris.txt 2 KB 01/21/2002
6. Annex D Location.txt 178 KB 01/21/2002
7. Annex D Sensitivity.txt 5,332 KB 01/21/2002

The PDE simulator response messages presented in this Annex assume the pilot phase offset assignment shown in Table E.1. This assignment must be changed and the corresponding PDE simulator response message field values corrected accordingly if the test equipment used in the tests is configured with a different pilot phase offset assignment.

Table E.1 Pilot PN Offset and BASE_ID Assignment Used in the PDE Simulator Response Messages

Pilot PN Offset	Numerical Value (in units of 64 CDMA Chips)	BASE_ID (Decimal)
P ₀	0	0
P ₁	1	4
P ₂	2	5
P ₃	3	3
P ₄	4	1
P ₅	5	2
P ₆	6	6
P ₇	7	7
P ₈	8	8
P ₉	9	9
